

Discussion:

Higgs couplings and SM calculations (15')

- How far can we expect to be at the end of the LHC with precision measurements on Higgs couplings ?
- Will the accumulated data be enough to achieve useful constraints ?
- Which experimental uncertainties will limit these measurements ? Are they common between ATLAS/CMS/LHCb ?
- Were we / are we being too conservative ? Can we go further ?
- Which theory calculations could be a limiting factor to the Higgs couplings measurements and would need to be improved for HL-LHC ?
