Exotic and Conventional Quarkonium Physics Prospects at Belle II

Thursday, 8 August 2019 12:00 (12 minutes)

Summary

The Belle II experiment at the SuperKEKB energy-asymmetric e^+e^- collider is a substantial upgrade of the B factory facility at KEK in Tsukuba, Japan. It aims to record a factor of 50 times more data than its predecessor. The experiment completed a commissioning run in 2018, and began full operation in early 2019. Belle II is uniquely capable of studying the so-called “XYZ” particles: heavy exotic hadrons consisting of more than three quarks. First discovered by Belle, these now number in the dozens, and represent the emergence of a new category within quantum chromodynamics. This talk will present the prospects of Belle II to explore both exotic and conventional quarkonium physics.

Primary author: PERUZZI, Ida (Laboratori Nazionali di Frascati dell’INFN)

Presenter: FULSOM, Bryan (Pacific Northwest National Laboratory)

Session Classification: Flavour Physics (Parallel)

Track Classification: Quark/Lepton Flavour Physics
