

# Studies of Higgs boson production in association with a $t\bar{t}$ pair

Alexander Held<sup>123</sup> on behalf of the ATLAS Collaboration

<sup>1</sup> CERN

<sup>2</sup> TRIUMF

<sup>3</sup> University of British Columbia

**26<sup>th</sup> International Conference on Supersymmetry and Unification of Fundamental Interactions  
(Barcelona)**

July 23-27, 2018

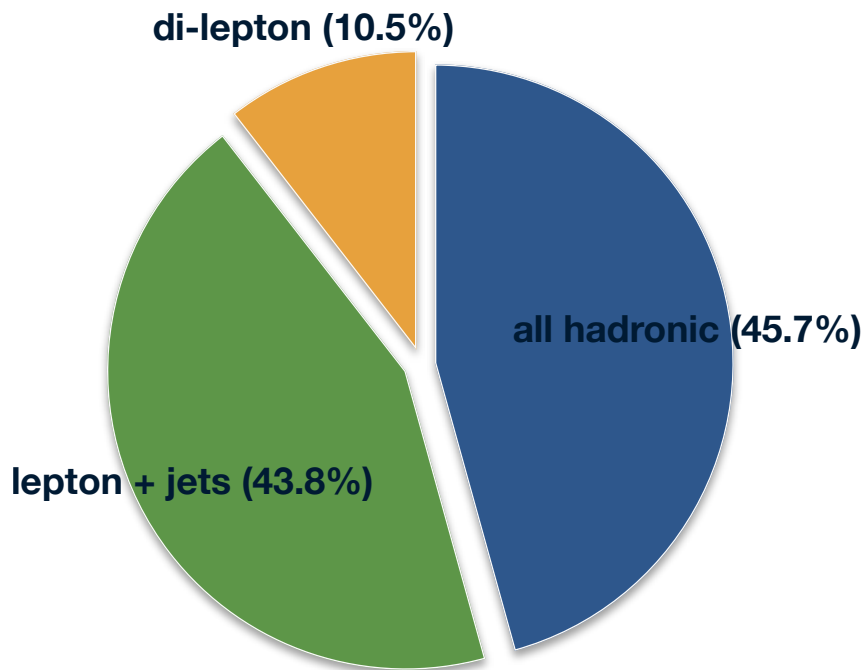

*This research project has been supported by a Marie Skłodowska-Curie Innovative Training Network Fellowship of the European Commission's Horizon 2020 Programme under contract number 675440 AMVA4NewPhysics.*

- **Top-Higgs Yukawa** coupling  $y_t$ 
  - Largest Yukawa coupling in the SM,  $y_t \cong 1$
  - Sensitive to new physics
- **Indirect measurements** of  $y_t$  via **ggF** and **H→γγ** loop
  - Must rely on assumptions of particles entering loops
- **ttH** provides **direct probe for top-Higgs Yukawa** coupling  $y_t^2$ 
  - Measurement is important check of SM

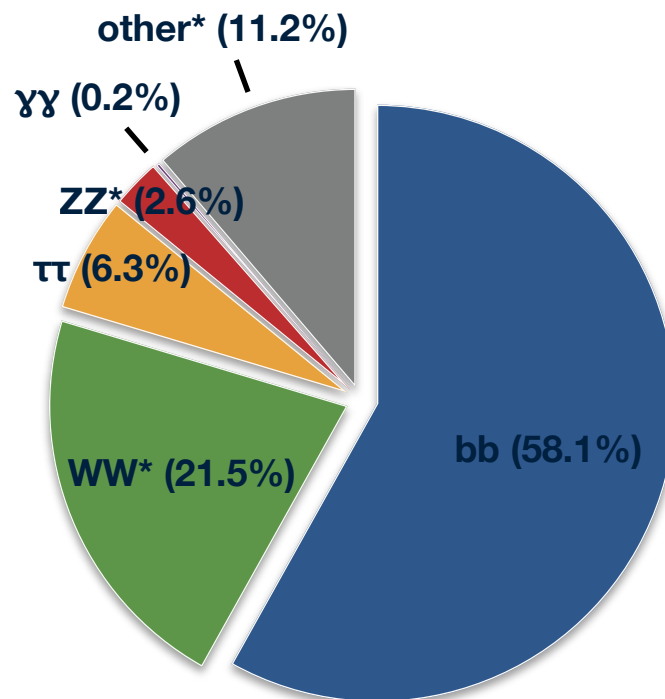

## ttbar decay BRs

- all hadronic (45.7%)
- lepton + jets (43.8%)
- di-lepton (10.5%)

## Higgs decay BRs

- bb (58.1%)
- WW\* (21.5%)
- $\tau\tau$  (6.3%)
- ZZ\* (2.6%)
- $\gamma\gamma$  (0.2%)
- other\* (11.2%)

**smaller BR,  
higher purity  
(generally)**

• **Wide variety of final states accessible**, good understanding of all reconstructed objects is crucial!

\*other: gg, cc, Z $\gamma$ ,  $\mu\mu$  etc.

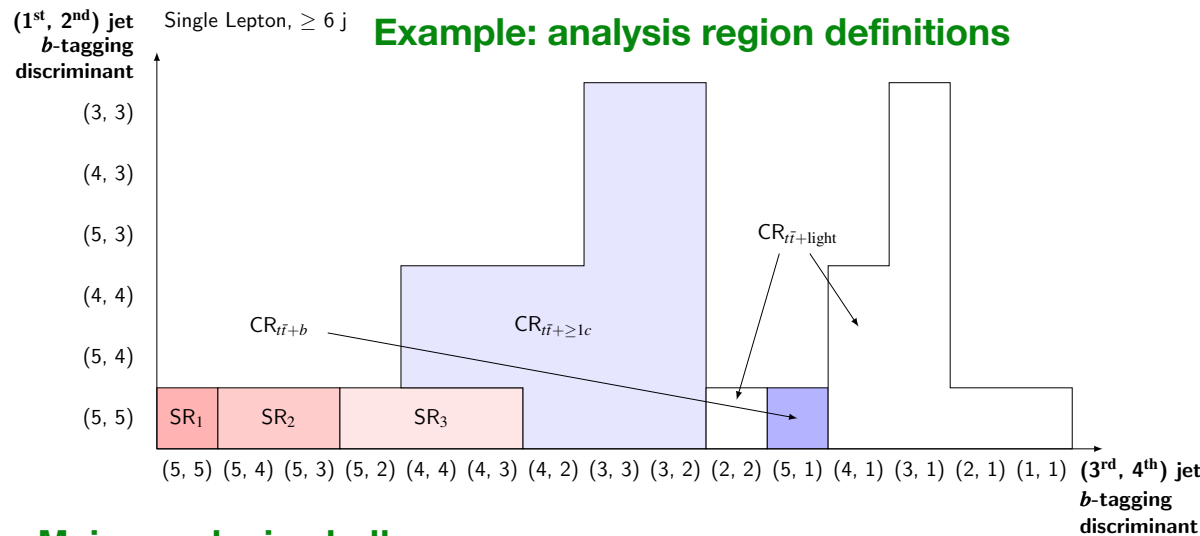

- bb (58.1%)
- WW (21.5%)
- $\tau\tau$  (6.3%)
- ZZ (2.6%)
- $\gamma\gamma$  (0.2%)
- other (11.2%)

**smaller BR,  
higher purity**  
(generally)

Channel	Dataset	Reference
ttH(bb)	36.1 fb <sup>-1</sup> , 13 TeV	<a href="#">Phys. Rev. D 97, 072016</a>
ttH multi-lepton (mostly H→WW* and H→ $\tau\tau$ )	36.1 fb <sup>-1</sup> , 13 TeV	<a href="#">Phys. Rev. D 97, 072003</a>
ttH(ZZ*→4l)	79.8 fb <sup>-1</sup> , 13 TeV	<a href="#">CERN-EP-2018-138</a> submitted to PLB
ttH( $\gamma\gamma$ )	79.8 fb <sup>-1</sup> , 13 TeV	
ttH combination	36.1 - 79.8 fb <sup>-1</sup> , 13 TeV	

• **Analysis regions:**

- **Single lepton channel:** 1 light lepton (e,μ), ≥5 jets
- **Di-lepton channel:** 2 light leptons (e,μ), ≥3 jets
- **Boosted channel:** large-R top-like and Higgs-like jets
- **Regions built using 5 b-tagging working points and N<sub>jets</sub>**
  - Helps constrain tt + ≥1b / tt + ≥1c / tt + light modelling

• **Major analysis challenge:**

- **Modelling of tt + heavy flavour background**
  - 5-flavour scheme sample, re-weighted tt + ≥1b components to 4-flavour scheme prediction
  - Large modelling uncertainties on ttbar (especially for tt + heavy flavour)

**b-tagger performance**

**irreducible tt+bb background**

• **Signal extraction strategy:**

- **Intermediate MVAs** aimed at signal reconstruction
- Fit performed on **classification BDT** (inputs: **intermediate** step, kinematics, b-tagging info)

**Intermediate MVAs:**

- ttH system reconstruction BDT
- Likelihood discriminant
- Matrix Element Method

**Classification BDT**

**example: reconstructed Higgs mass**

**example: classification BDT**

**Fit model:**

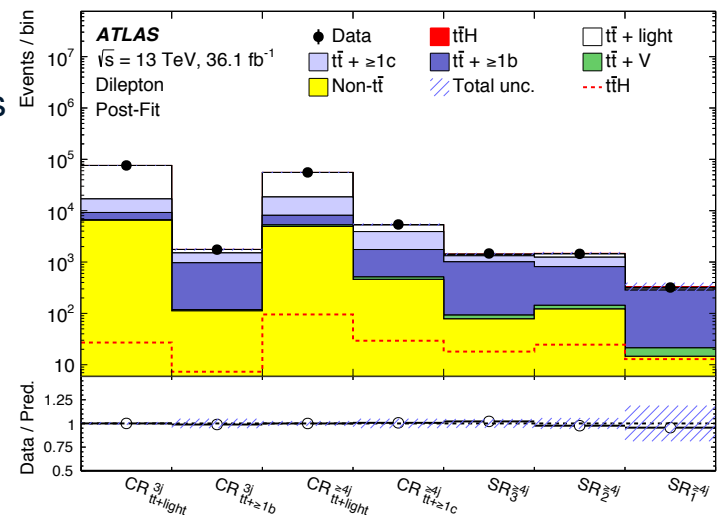

- ▶ Profile likelihood fit of 10 control regions and 9 signal regions
- ▶ BDT distributions in all signal regions
- ▶ H<sub>T</sub> (scalar sum of jet p<sub>T</sub>) or single bin in control regions
- ▶ Free-floating tt + ≥1b and tt + ≥1c normalization

**significance: 1.4σ  
(1.6σ expected)**

**Dominant uncertainties on  $\mu_{\text{ttH}}$ :**

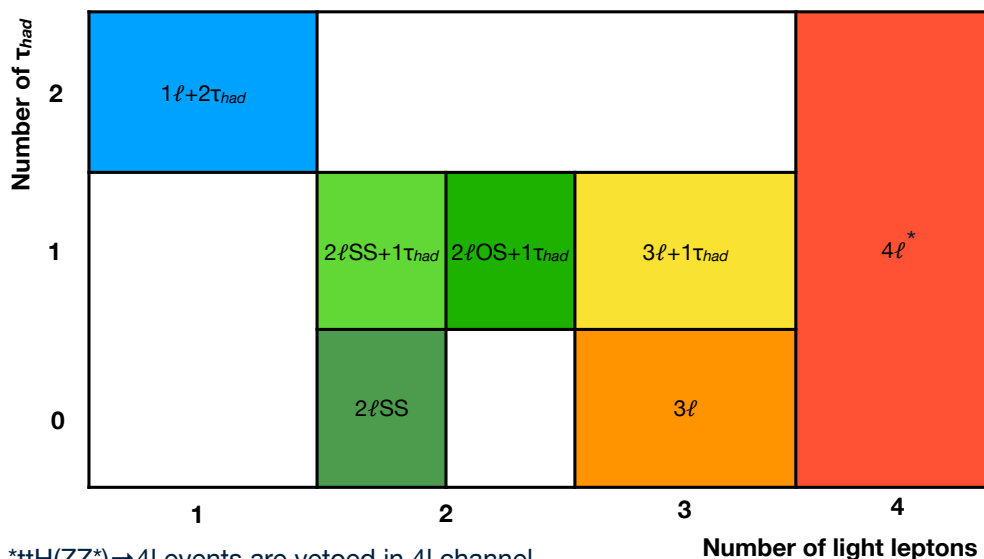

- ▶ tt + ≥1b modelling (+0.46, -0.46)
- ▶ MC statistical uncertainties (+0.29, -0.31)
- ▶ b-tagging (+0.16, -0.16)

→ significant experimental and theoretical progress needed for further improvements!

- **7 different analysis channels** with different **e/μ** and **hadronic τ multiplicity**
  - ≥1 b-jet, 2-4 jets
- **Isolation/b-tagging BDT** for light lepton selection, veto on **charge mis-ID BDT**
- **Backgrounds:**
  - **Irreducible:** dominated by **tt+V** and **VV**
    - Taken from MC and validated in data
  - **Reducible:** **non-prompt e/μ/τ**, charge misidentified e/μ
    - Estimated from data

\*ttH(ZZ\*) → 4ℓ events are vetoed in 4ℓ channel

• **Signal extraction:**

- **Dedicated MVA approaches** in most channels, examples:
  - **2l SS:** combination of two BDTs (trained against fakes and ttV)
  - **3l SR and CRs:** multi-class BDT (5 classes)

**BDT in 2l SS region**

**BDT in 3l SR**

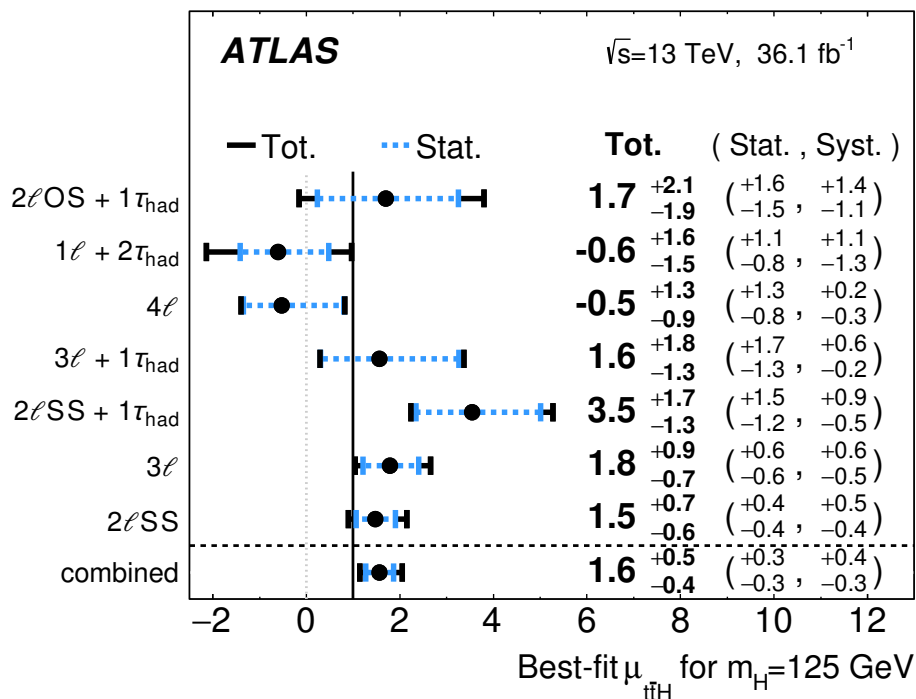

• **Fit model:**

▸ **Combined profile likelihood fit** of all signal and control regions

- **BDT discriminants** in most signal regions

- **Control regions** validate irreducible backgrounds

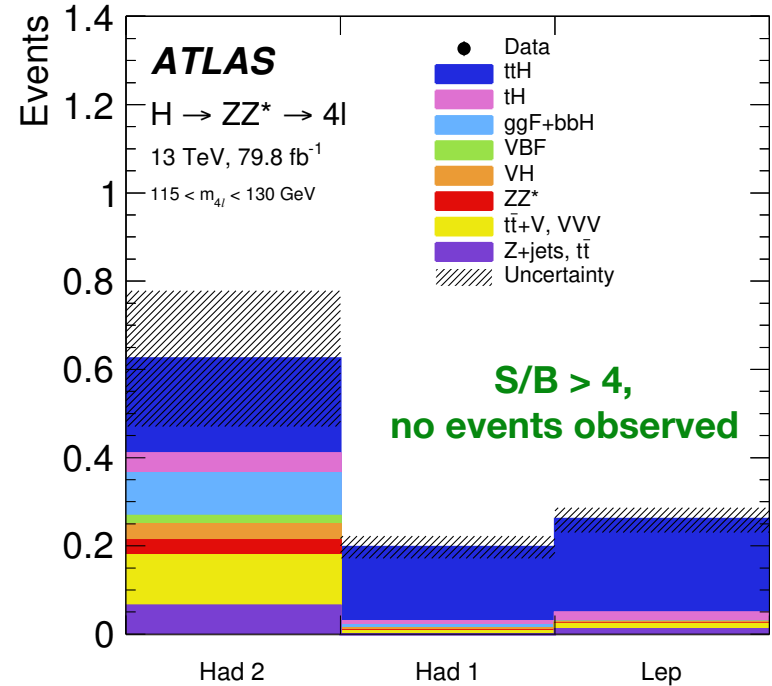

• **Dominant systematic uncertainties on  $\mu_{ttH}$ :**

- ttH cross-section (+0.20 -0.09)
- Jet energy scale and resolution (+0.18 -0.15)
- Non-prompt e/μ estimates (+0.15 -0.13)

**significance: 4.1σ**  
**(2.8σ expected)**

- **New for summer 2018:** analysis with 79.8 fb<sup>-1</sup>
- **Selection:**
  - ▶ **115 GeV < m<sub>4l</sub> < 130 GeV**
  - ▶ **Hadronic-enriched region:**
    - ≥4 jets, ≥1 b-tag, no additional light leptons
    - Split in two bins using a BDT (“Had 1”, “Had 2”)
  - ▶ **Leptonic-enriched region**
    - ≥2 jets, ≥1 b-tag, ≥1 additional light lepton
- **Major backgrounds:**
  - ▶ ttV, other Higgs production modes
- **Extremely statistically limited:**
  - ▶ no events observed in signal region
    - 1.1 events expected (0.6 ttH)
  - ▶ Expected sensitivity: 1.2σ

**hadronic selection, relaxed m<sub>4l</sub> cut**

- **New for summer 2018:** analysis with 79.8 fb<sup>-1</sup>

- **Analysis regions:**

- **Hadronic region “Had”:**

- $\geq 3$  jets,  $\geq 1$  b-tag, no light leptons (e/ $\mu$ )

- **Leptonic region “Lep”:**

- $\geq 1$  b-tagged jet,  $\geq 1$  light lepton (e/ $\mu$ )

- **Defining signal-enriched regions:**

- **BDTs implemented via XGBoost**

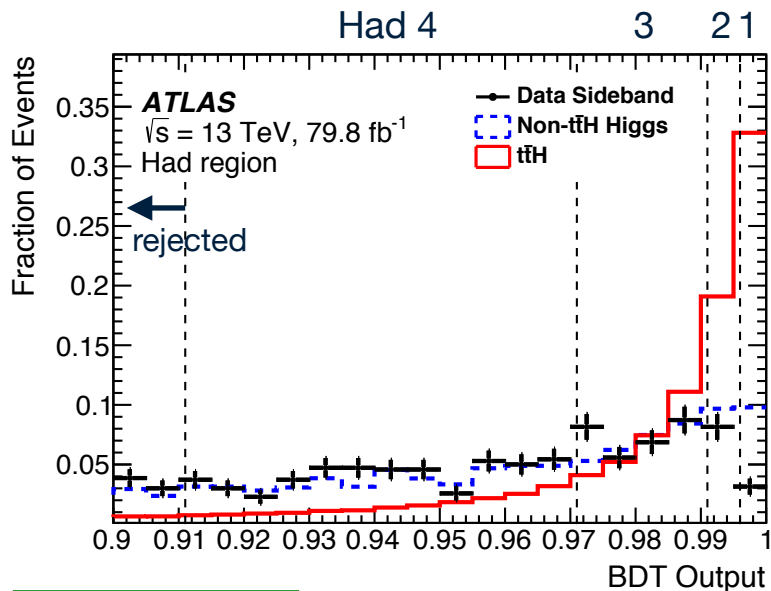

- **Inputs include:** photon kinematics ( $p_T/m_{\gamma\gamma}$ ,  $\eta$ ,  $\phi$ ) and jet 4-vectors

- **Signal:** ttH (from simulation)

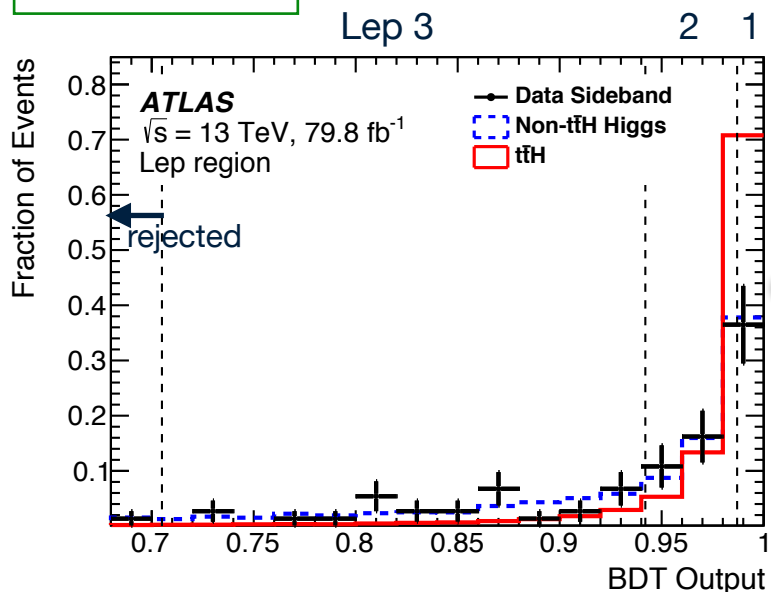

- **Backgrounds:**  $\gamma\gamma$ , tt+ $\gamma\gamma$  (data in control regions), other Higgs production (from simulation)

- **Perform cut on BDT output to veto backgrounds**

- Categorize events passing cut

Zoomed views

• **Analysis regions:**

- **Hadronic region “Had”:**
  - 4 sub-categories, after BDT cut
- **Leptonic region “Lep”:**
  - 3 sub-categories, after BDT cut

• **Fit details:**

- **Simultaneous unbinned fit of  $m_{\gamma\gamma}$**  (105-160 GeV) in all 7 categories
- **ttH signal:** double-sided crystal ball
- **Continuum background:** smooth functions (power-law or exponential)

• **Significance:**

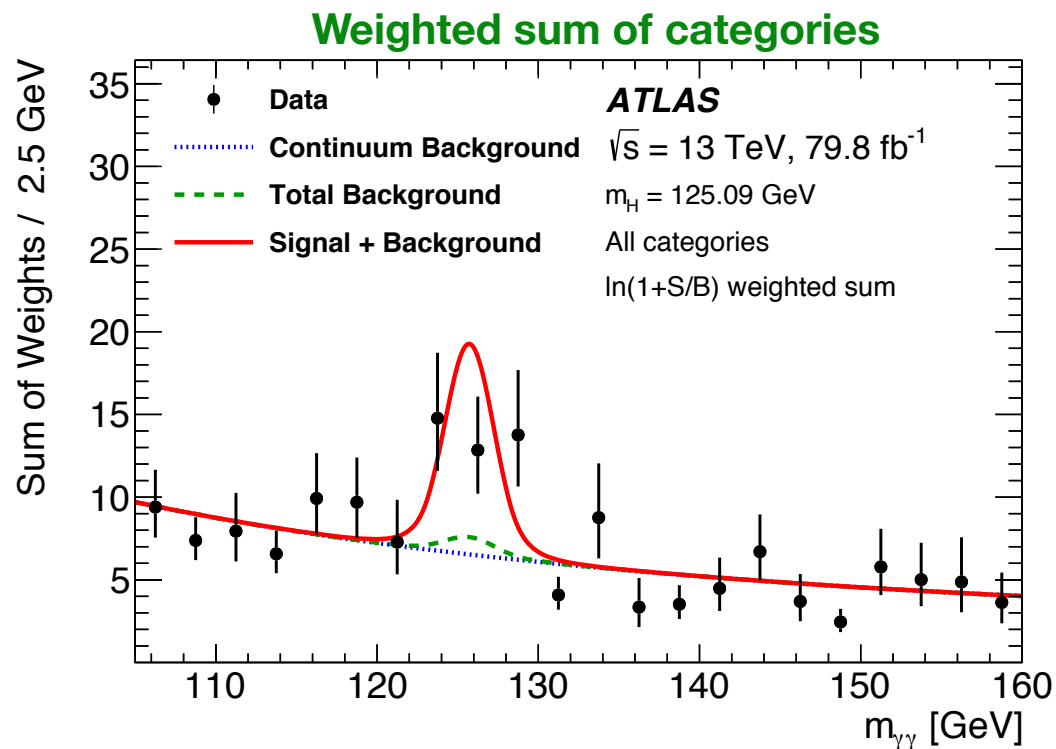

- **4.1 $\sigma$  (3.7 $\sigma$  expected)**
  - Had: 3.8 $\sigma$  (2.7 $\sigma$ ), Lep: 1.9 $\sigma$  (2.5 $\sigma$ )

• **Dominant uncertainties:**

- Statistically dominated
- ttH shower & hadronization (8%)
- Photon isolation, resolution, scale (8%)
- Jet energy scale (5%)

• **50% more sensitive than previous result:**

- Inclusion of 4-momentum information of objects (30% improvement for same luminosity)
- Improved reconstruction and selection

**Inputs:**

- bb, multi-lepton: 36.1 fb<sup>-1</sup>;  $\gamma\gamma, ZZ^* \rightarrow 4\ell$ : 79.8fb<sup>-1</sup>

**Combination details:**

- Theory uncertainties correlated
- Experimental uncertainties largely uncorrelated
- Other Higgs production modes fixed to SM

**Dominant systematic uncertainties:**

- tt + heavy flavour modelling (12%)
- ttH modelling (10%)
- Experimental uncertainties (9%)

Analysis	Integrated luminosity [fb <sup>-1</sup> ]	Expected significance	Observed significance
$H \rightarrow \gamma\gamma$	79.8	3.7 $\sigma$	4.1 $\sigma$
$H \rightarrow$ multilepton	36.1	2.8 $\sigma$	4.1 $\sigma$
$H \rightarrow b\bar{b}$	36.1	1.6 $\sigma$	1.4 $\sigma$
$H \rightarrow ZZ^* \rightarrow 4\ell$	79.8	1.2 $\sigma$	0 $\sigma$
Combined (13 TeV)	36.1–79.8	4.9 $\sigma$	5.8 $\sigma$
Combined (7, 8, 13 TeV)	4.5, 20.3, 36.1–79.8	5.1 $\sigma$	6.3 $\sigma$

**observation of ttH!**

clear excess in high S/B bins, consistent with **ttH** signal

Analysis	Integrated luminosity [fb <sup>-1</sup> ]	ttH cross section [fb]
$H \rightarrow \gamma\gamma$	79.8	$710^{+210}_{-190}$ (stat.) $^{+120}_{-90}$ (syst.)
$H \rightarrow$ multilepton	36.1	$790 \pm 150$ (stat.) $^{+150}_{-140}$ (syst.)
$H \rightarrow b\bar{b}$	36.1	$400^{+150}_{-140}$ (stat.) $\pm 270$ (syst.)
$H \rightarrow ZZ^* \rightarrow 4\ell$	79.8	<900 (68% CL)
<b>Combined (13 TeV)</b>	<b>36.1–79.8</b>	<b><math>670 \pm 90</math> (stat.) <math>^{+110}_{-100}</math> (syst.)</b>

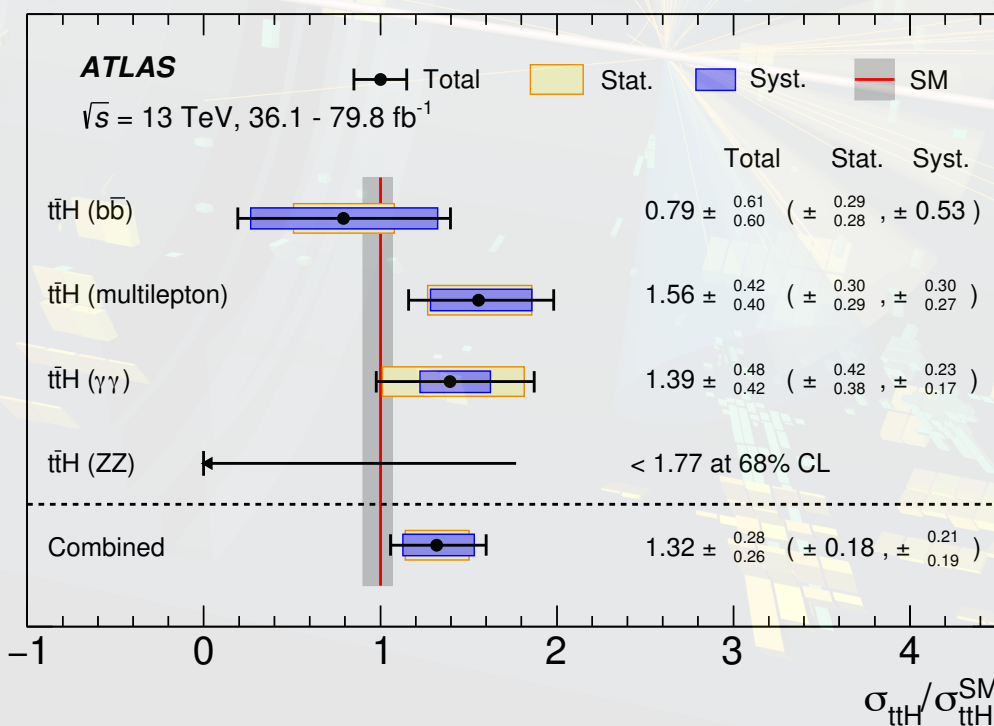

- Compare to:  $\sigma_{ttH}^{SM} = 507^{+35}_{-50}$  fb
  - Measurement **consistent with SM prediction!**
- Combination is **assuming SM branching ratios**

- Observation of ttH production process:**

- 6.3σ significance (5.1σ expected)

- Good agreement with SM:**  $\sigma_{t\bar{t}H} = 670 \pm 90 \text{ (stat.) } {}^{+110}_{-100} \text{ (syst.) fb}$

## **Studies of Higgs boson production in association with a $t\bar{t}$ pair**

The search for the production of the Higgs Boson with a pair of top-anti-top quarks is both very important and very challenging. This talk presents the analyses using Higgs boson decays to  $b\bar{b}$  pairs, to two Z bosons, to other multi-lepton final states, and to a pair of photons, using pp collision data collected at 13 TeV, as well as their combined results.
