Dark Matter: present and future of direct and indirect searches

Monday, 17 December 2012 09:10 (50 minutes)

Different techniques are being used to characterize the nature of Dark Matter, and to test whether its properties can explain the astronomers' puzzling observations: from underground detector to telescopes and satellites observing debris produced by Dark Matter annihilation in the Universe.

I will give a review of direct and indirect searches, focusing on some of the latest results and future projects.

Primary author: Dr VALLECORSA, Sofia (Israel Institute of Technology (IL))

Presenter: Dr VALLECORSA, Sofia (Israel Institute of Technology (IL))

Session Classification: Non accelerator searches for DM

Track Classification: Preliminary version of material to be approved
