

# The CLD (CLIC-like Detector) for FCC-ee

Emilia Leogrande (CERN),  
with contributions from Konrad Elsener and Oleksandr Viazlo  
and help from the CLICdp Collaboration

Detector Design Meeting  
30/01/2018

The CLD is derived from the most recent CLIC detector model (CLICdet)

- ☆ Silicon pixel vertex detector
- ☆ Silicon tracker
- ☆ Silicon-tungsten ECal
- ☆ Scintillator-steel HCal
- ☆ Superconducting solenoid interleaved with RPC muon chambers

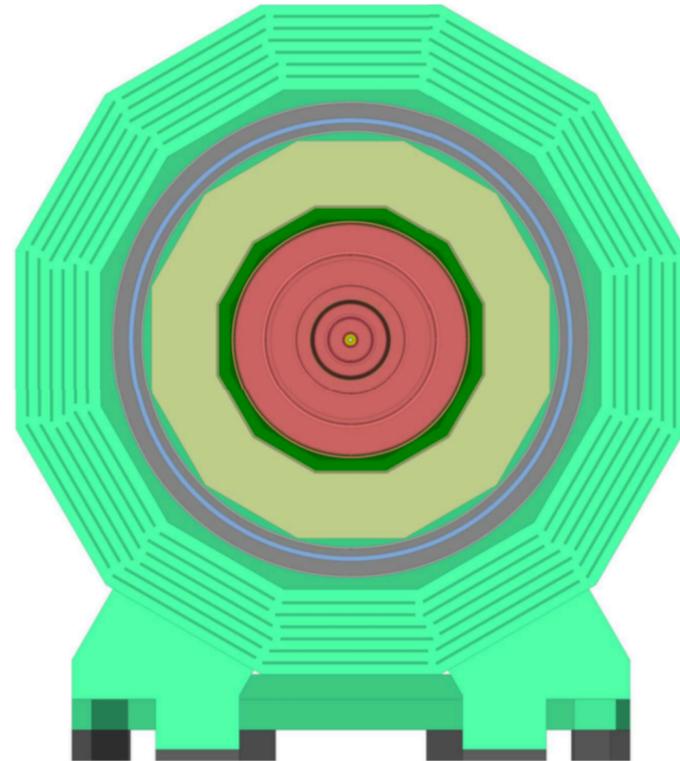

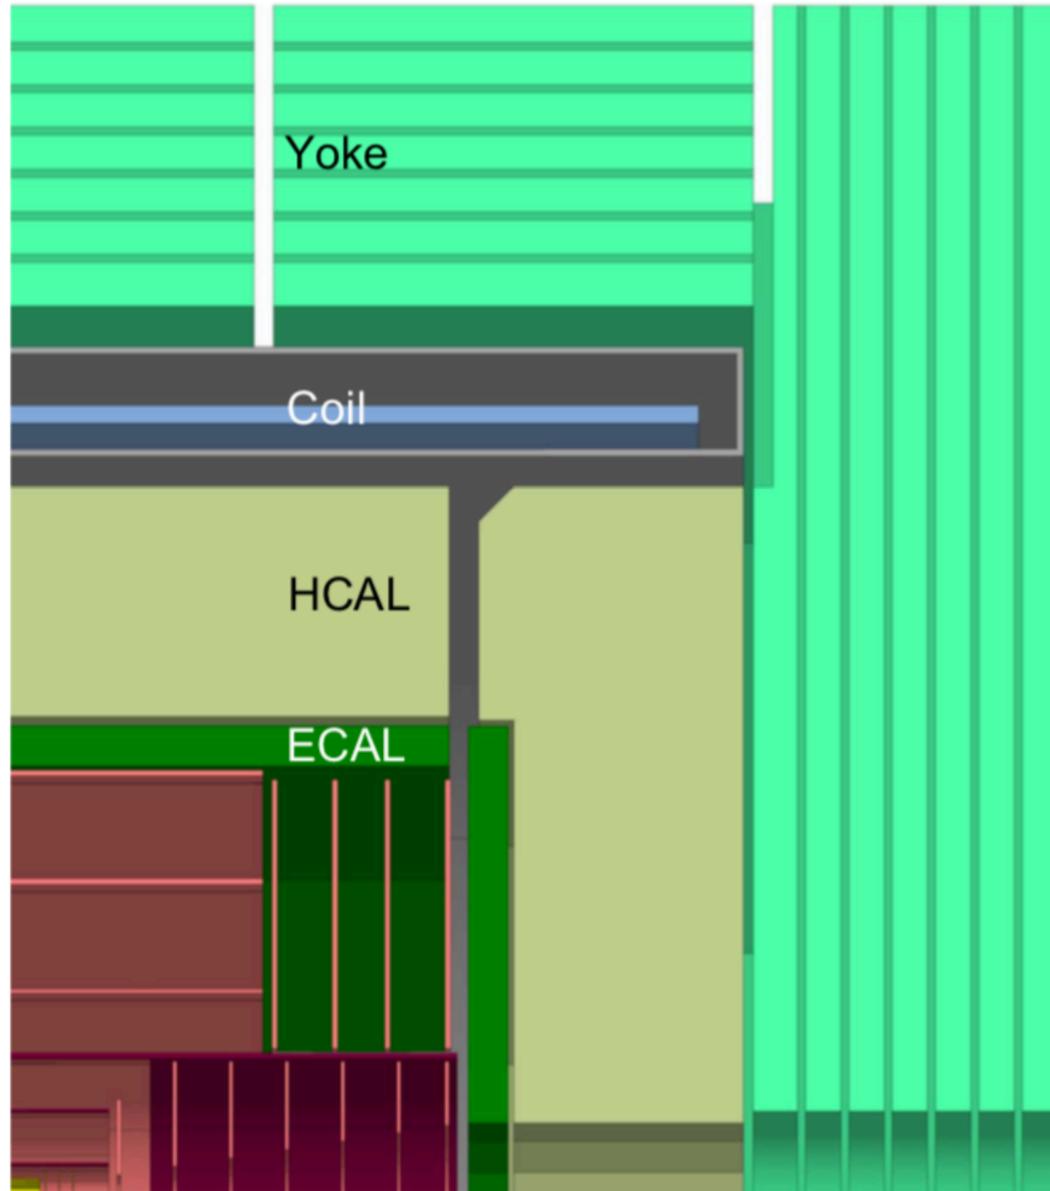

Constraints from the MDI at FCC-ee

- ☆ Detector solenoidal field 2T (4T for CLIC)
  - ◆ Outer tracker radius increased to 2.15m (1.5m for CLIC)
- ☆ Beampipe radius 15mm (29mm for CLIC)
  - ◆ Inner vertex radius decreased to 17mm (31mm for CLIC)
- ☆ Max collision energy 365GeV (3TeV for CLIC)
  - ◆ Hadronic calorimeter depth reduced to  $5.5\lambda_I$  ( $7.5\lambda_I$  for CLIC)
- ☆ Layout respects the 150mrad cone reserved for beam- and MDI-equipment

Constraints from the continuous operation at a circular collider

- ☆ Power pulsing not possible
- ☆ Need for detailed engineering studies on cooling systems

# Detector layout and main parameters

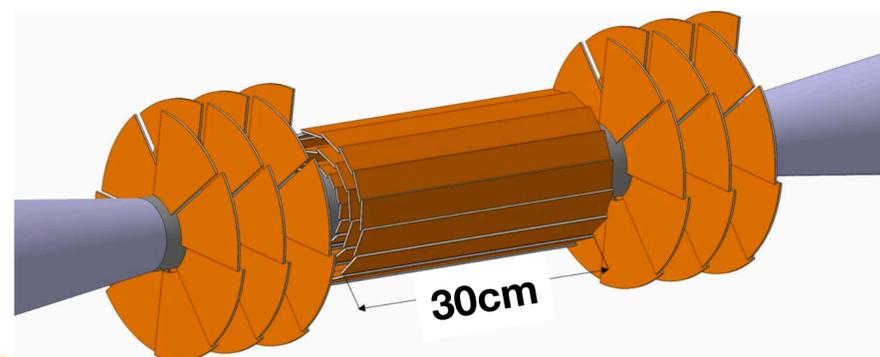

Concept	CLICdet	CLD
Vertex inner radius [mm]	31	17
Tracker technology	Silicon	Silicon
Tracker half length [m]	2.2	2.2
Tracker outer radius [m]	1.5	2.1
Inner tracker support cylinder radius [m]	0.575	0.675
ECAL absorber	W	W
ECAL $X_0$	22	22
ECAL barrel $r_{\min}$ [m]	1.5	2.15
ECAL barrel $\Delta r$ [mm]	202	202
ECAL endcap $z_{\min}$ [m]	2.31	2.31
ECAL endcap $\Delta z$ [mm]	202	202
HCAL absorber	Fe	Fe
HCAL $\lambda_I$	7.5	5.5
HCAL barrel $r_{\min}$ [m]	1.74	2.40
HCAL barrel $\Delta r$ [mm]	1590	1166
HCAL endcap $z_{\min}$ [m]	2.4	2.4
HCAL endcap $\Delta z$ [mm]	1590	1166
Solenoid field [T]	4	2
Solenoid bore radius [m]	3.5	3.7
Solenoid length [m]	8.3	7.4
Overall height [m]	12.9	12.0
Overall length [m]	11.4	7.5

# The vertex and tracker

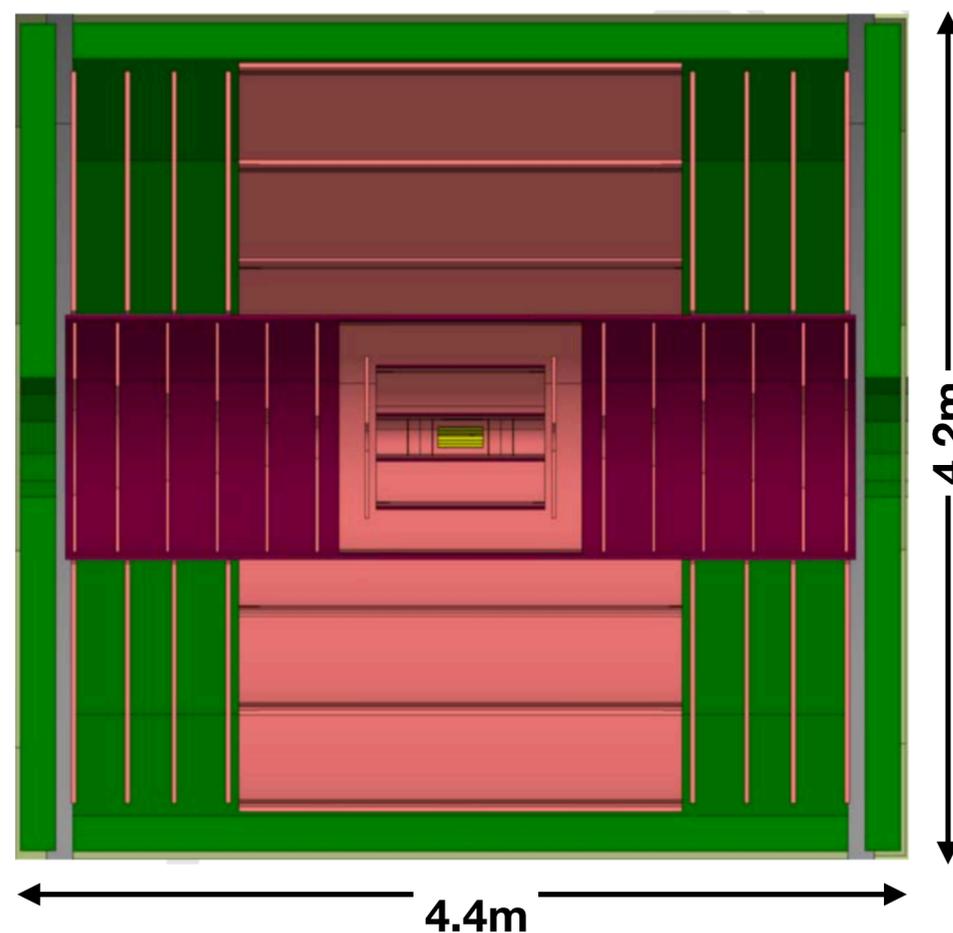

## Vertex detector

- ☆ Silicon pixels  $25 \times 25 \mu\text{m}^2$
- ☆ single point resolution =  $3 \mu\text{m}$
- ☆ 3 barrel double layers
- ☆ 3 sets of double disks
- ☆ material budget:  $0.3\%X_0$  per layer

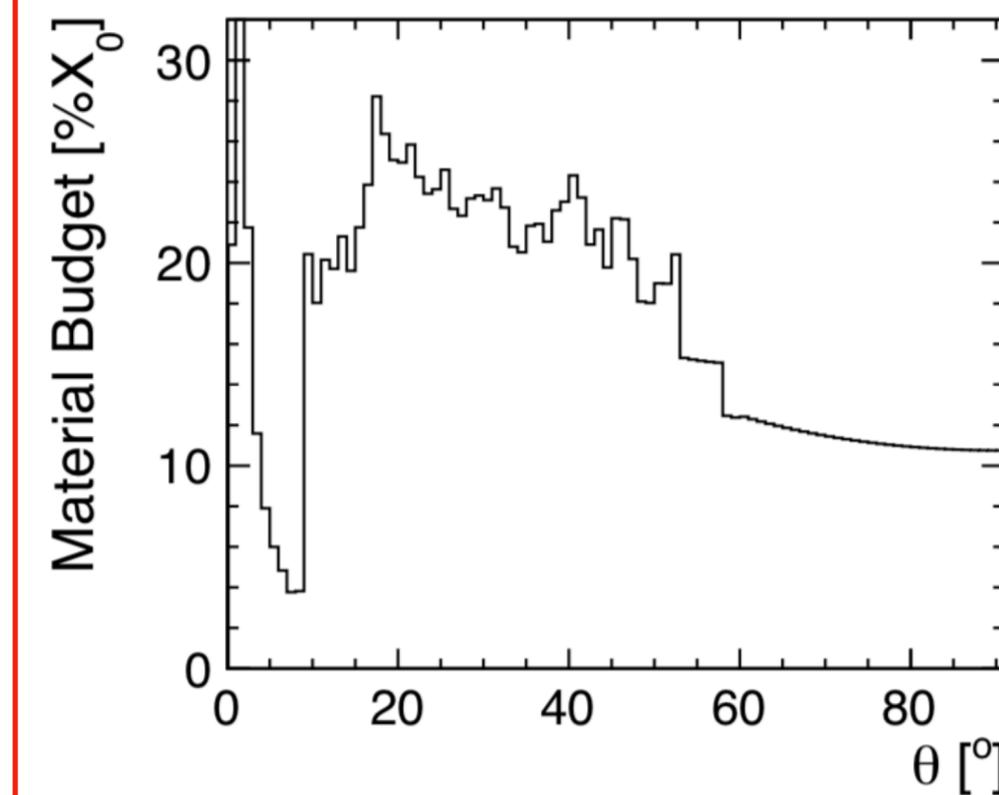

## Tracker detector

- ☆ Silicon pixels and microstrips
- ☆ inner tracker
  - ◆ 3 barrel layers, 5 disks
- ☆ outer tracker
  - ◆ 3 barrel layers, 4 disks
- ☆ single point resolution:
  - ◆ 1st inner disk:  $5 \mu\text{m} \times 5 \mu\text{m}$
  - ◆ all others:  $7 \mu\text{m} \times 90 \mu\text{m}$
- ☆ material budget:
  - ◆ barrel:  $1.2\%X_0$  per layer
  - ◆ endcap:  $1.4\%X_0$  per layer

## Total material budget [vertex+tracker]

# The ECal and HCal

Particle flow calorimetry requires high-granularity calorimeters

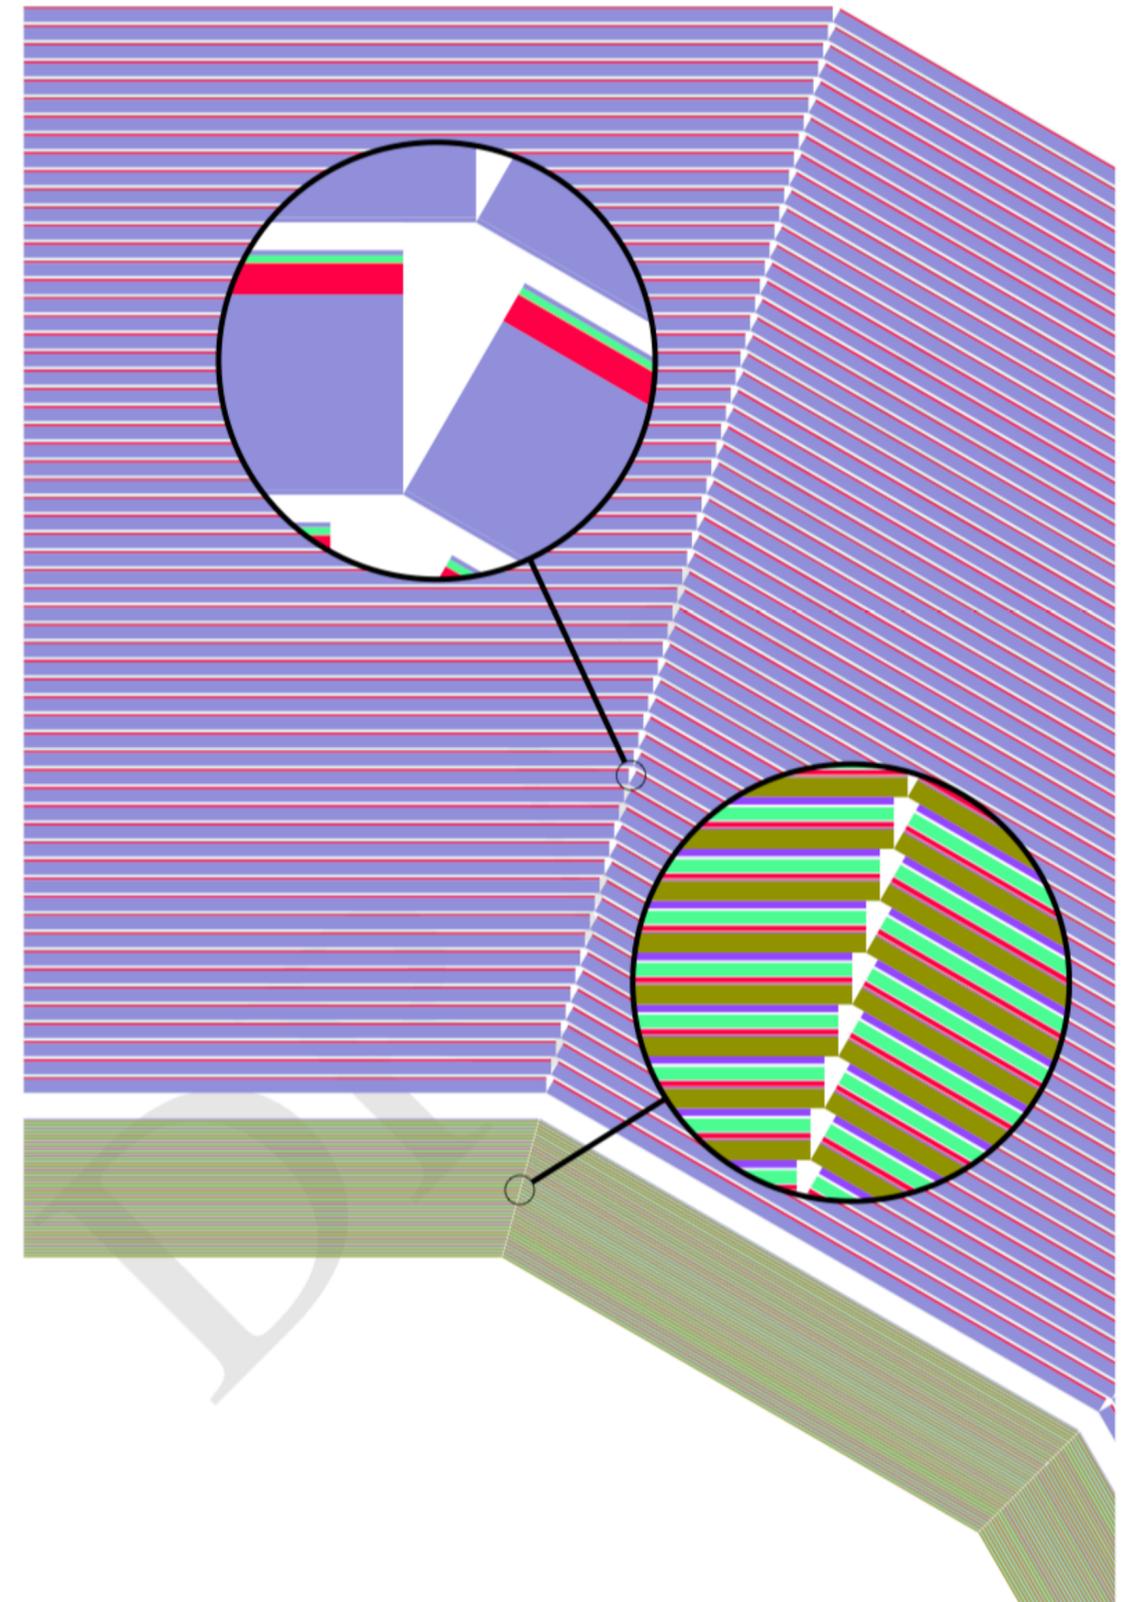

## ECal

- ☆ Si-W sampling calorimeter
- ☆ cell size  $5 \times 5 \text{ mm}^2$
- ☆ 40 layers (1.9mm thick W plates)
- ☆  $22X_0$

## HCal

- ☆ Scintillator-steel sampling calorimeter
- ☆ cell size  $30 \times 30 \text{ mm}^2$
- ☆ 44 layers (19mm thick steel plates)
- ☆  $5.5\lambda_I$

Combined thickness ECal + HCal =  $6.5\lambda_I$

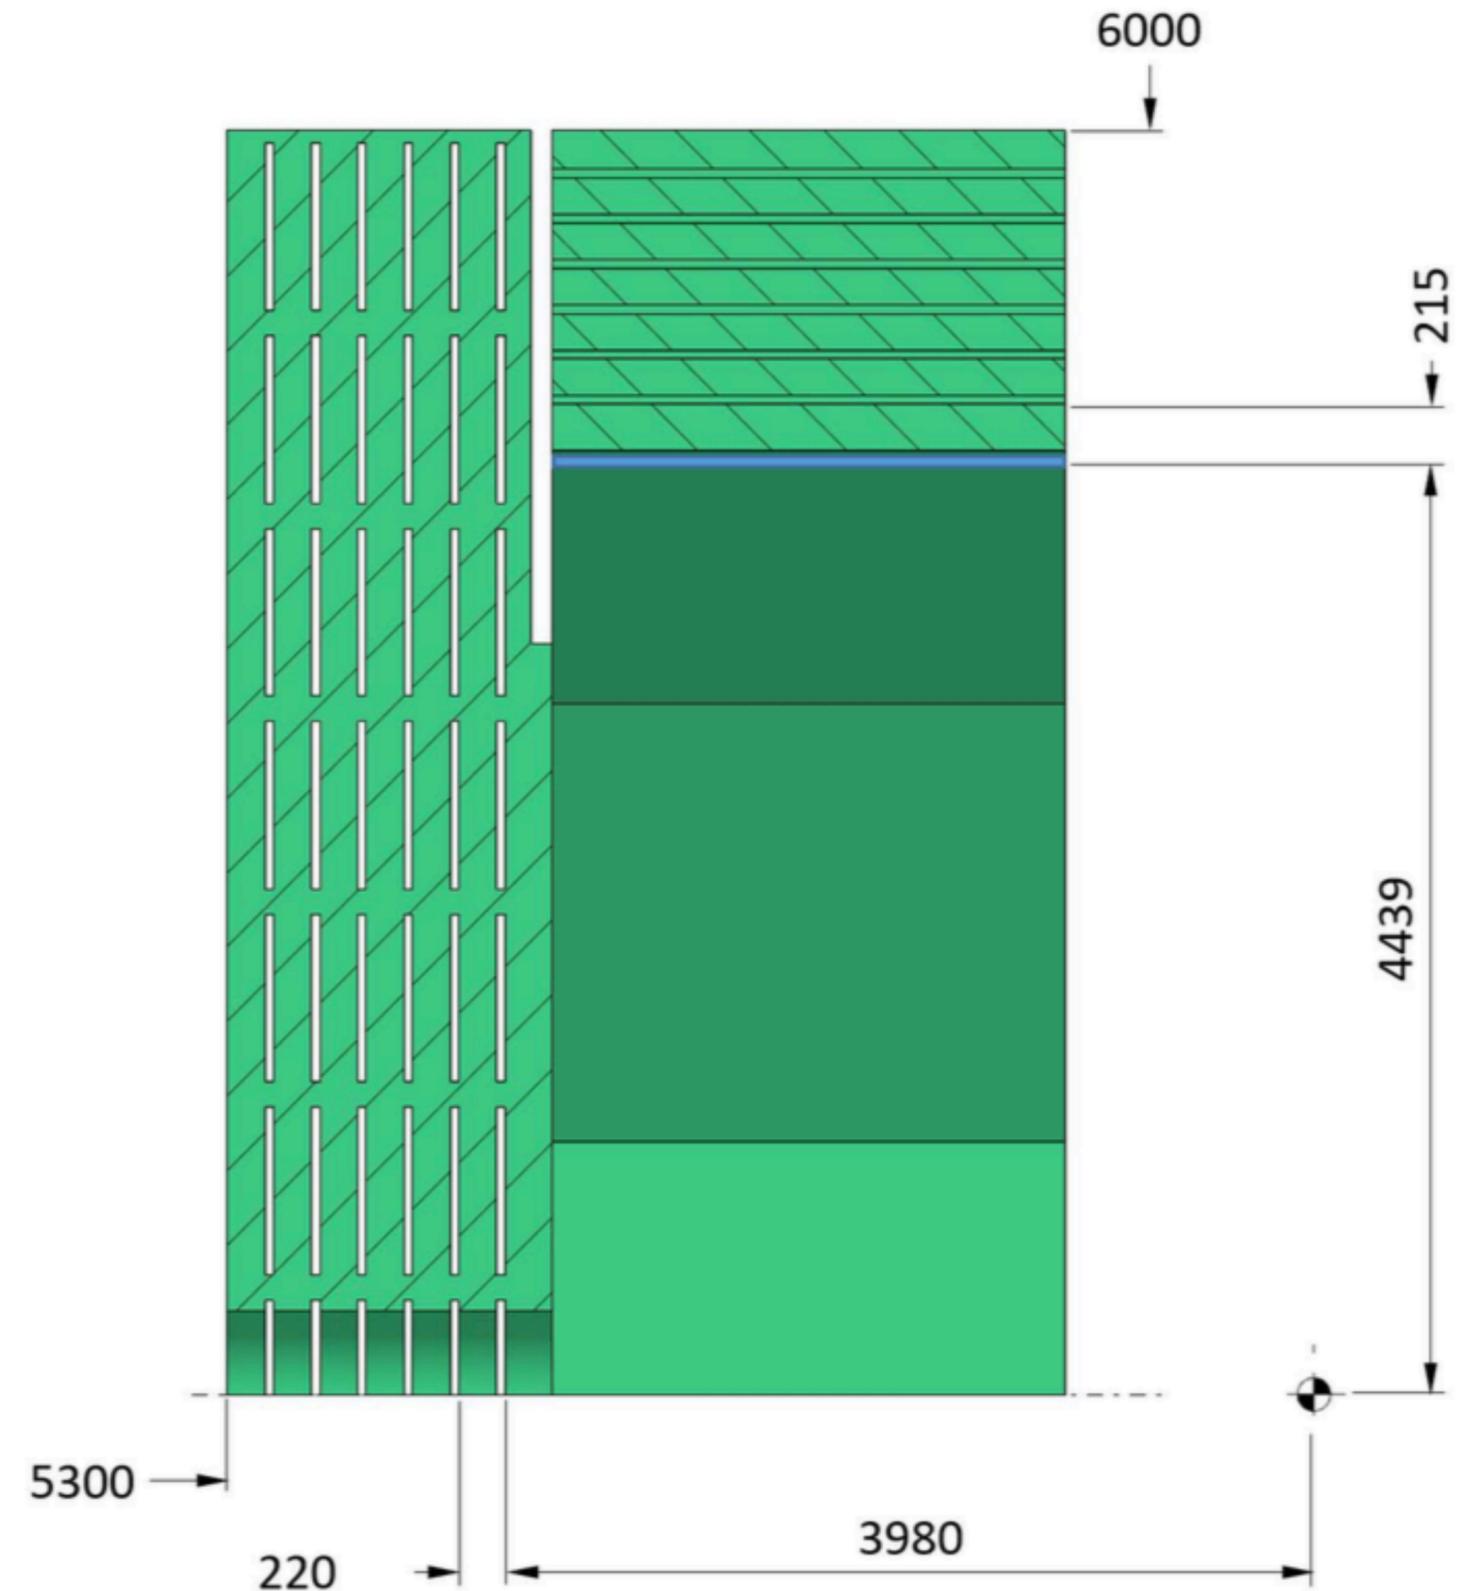

# The magnet and muon system

## The magnet system

- ☆ superconducting coil
  - ◆ 2T field
- ☆ return yoke
  - ◆ barrel: 1T field
  - ◆ endcap: no field in the simulation at the moment

## The muon system

- ☆ RPC chambers
  - ◆ 6 layers
  - ◆ additional possible 7th layer as close as possible to the coil, as tailcatcher for hadron showers
  - ◆ cell size 30 x 30 mm<sup>2</sup>

# SECTION 2: DETECTOR PERFORMANCES

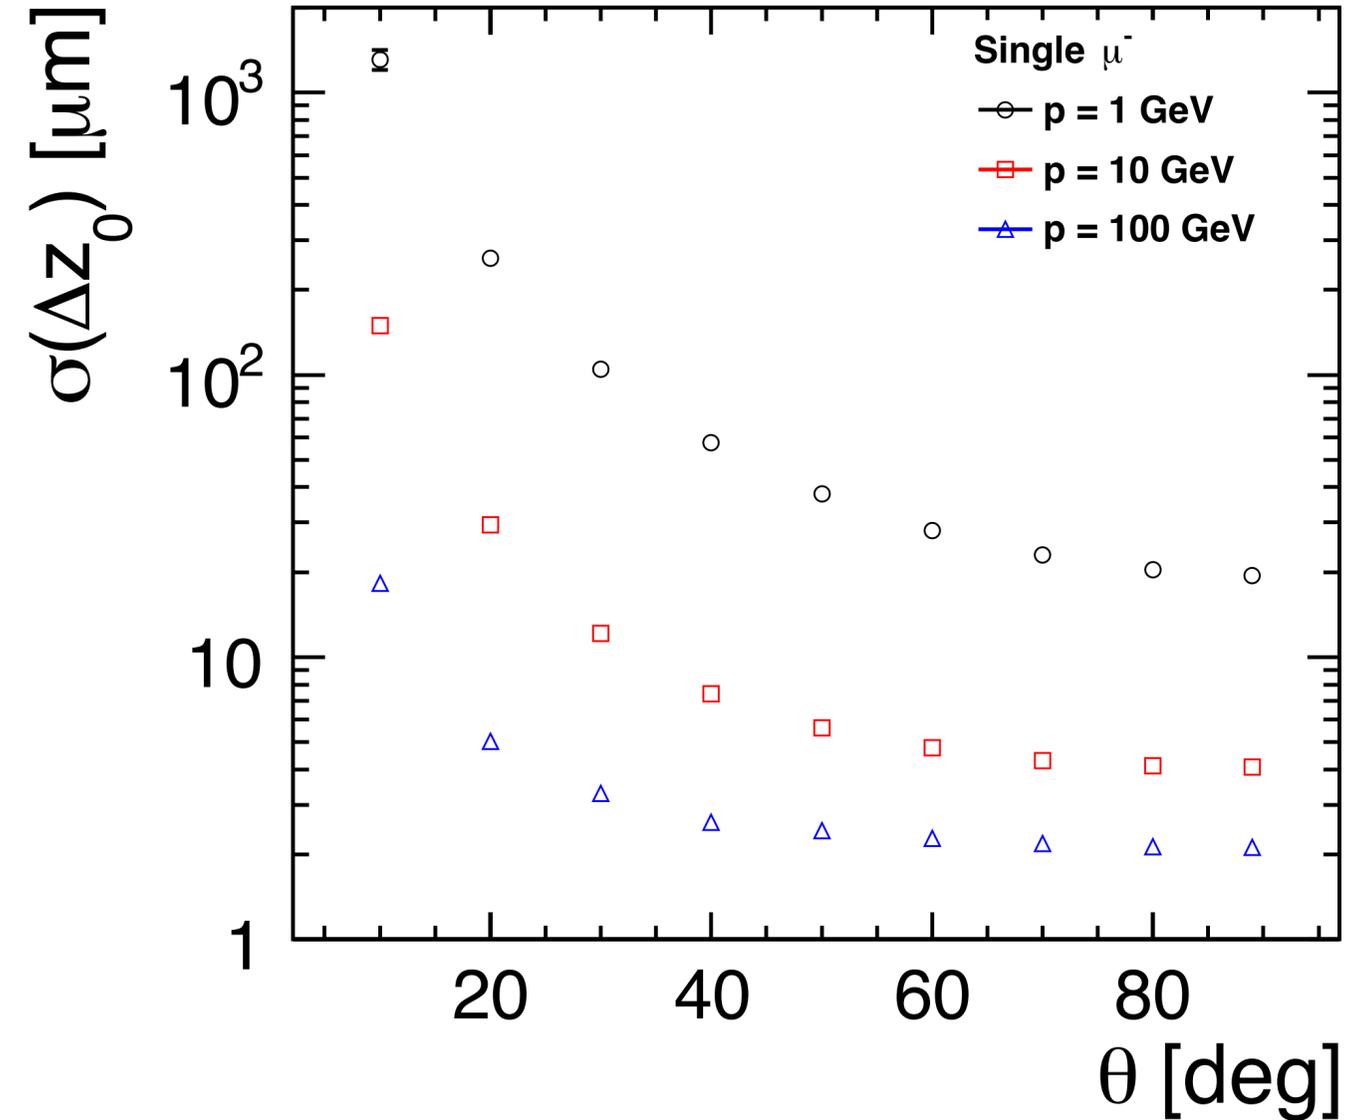

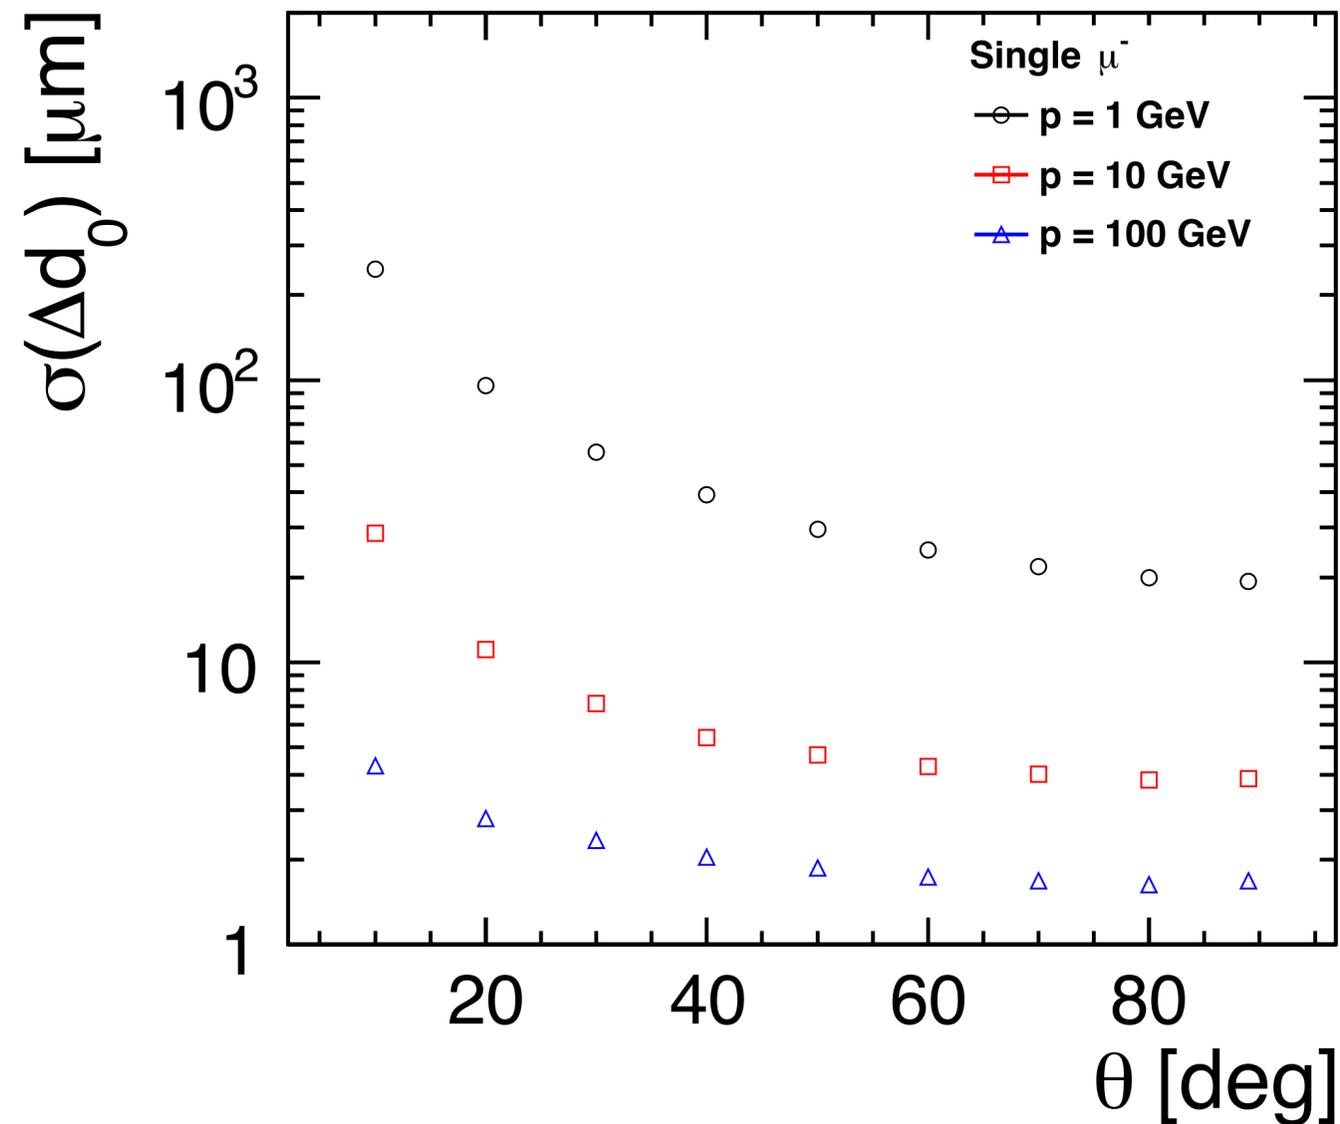

Detector performances are studied in full simulation with the iLCSoft (Linear Collider community software)

- ☆ **Tracking performances**
  - ◆ impact parameter resolution
  - ◆ angular resolution
  - ◆ momentum resolution
  - ◆ single particle efficiency
  - ◆ complex events efficiency
  
- ☆ **Calorimeters performances**
  - ◆ photon energy resolution
  - ◆ kaon energy resolution
  - ◆ jet energy resolution
  - ◆ photon ID efficiency
  - ◆ charged particles efficiency

# Impact parameter resolution

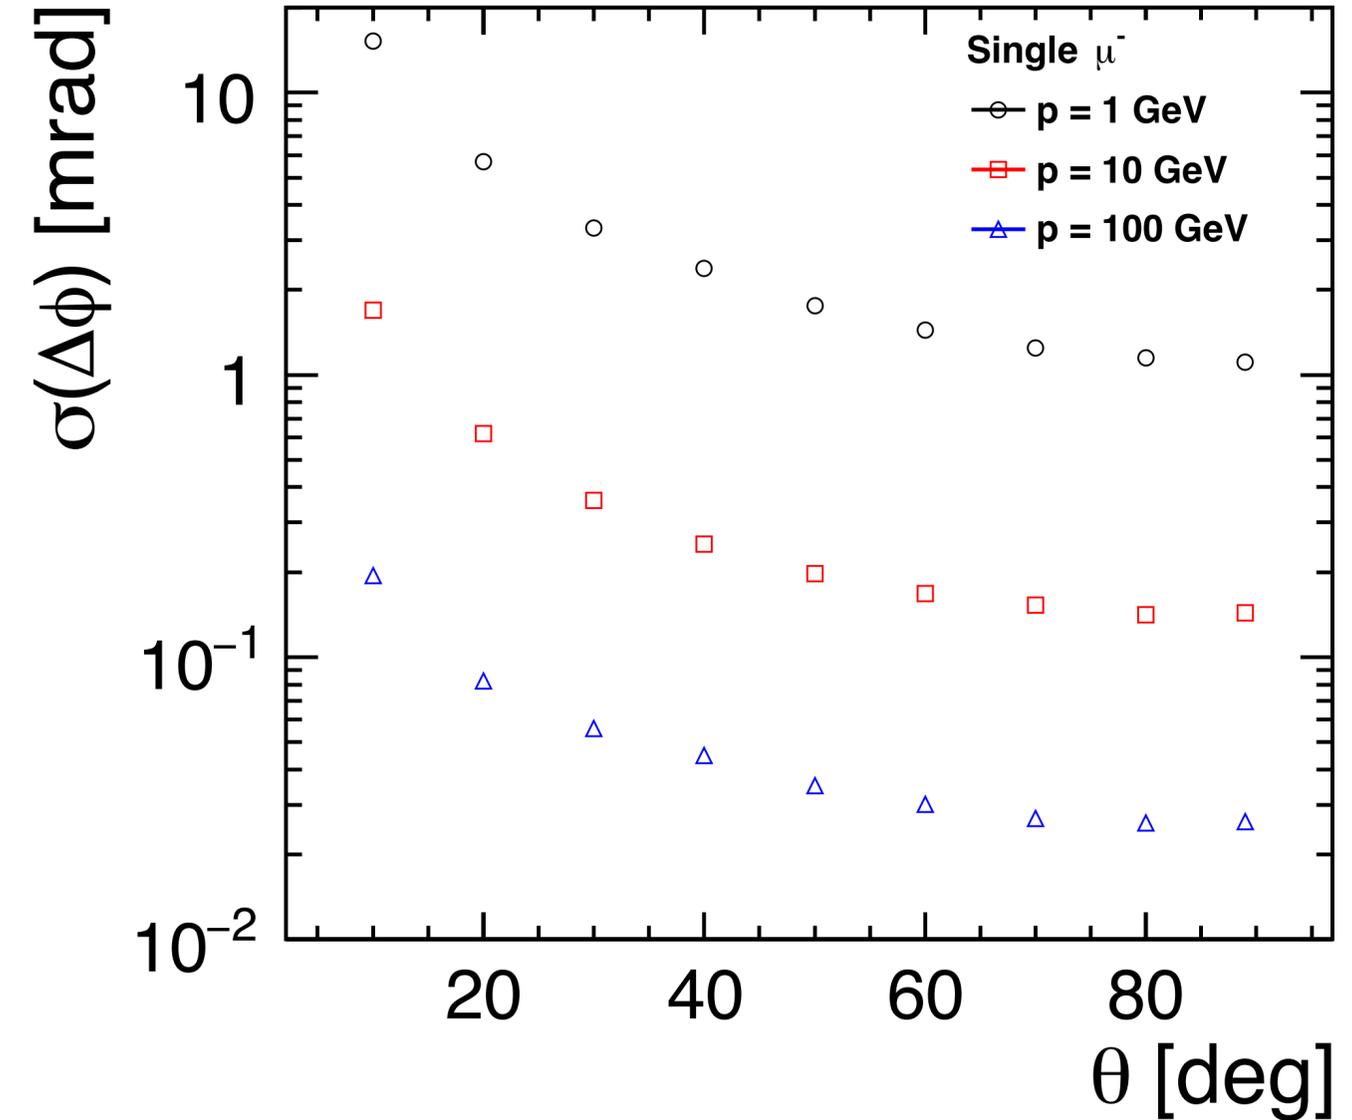

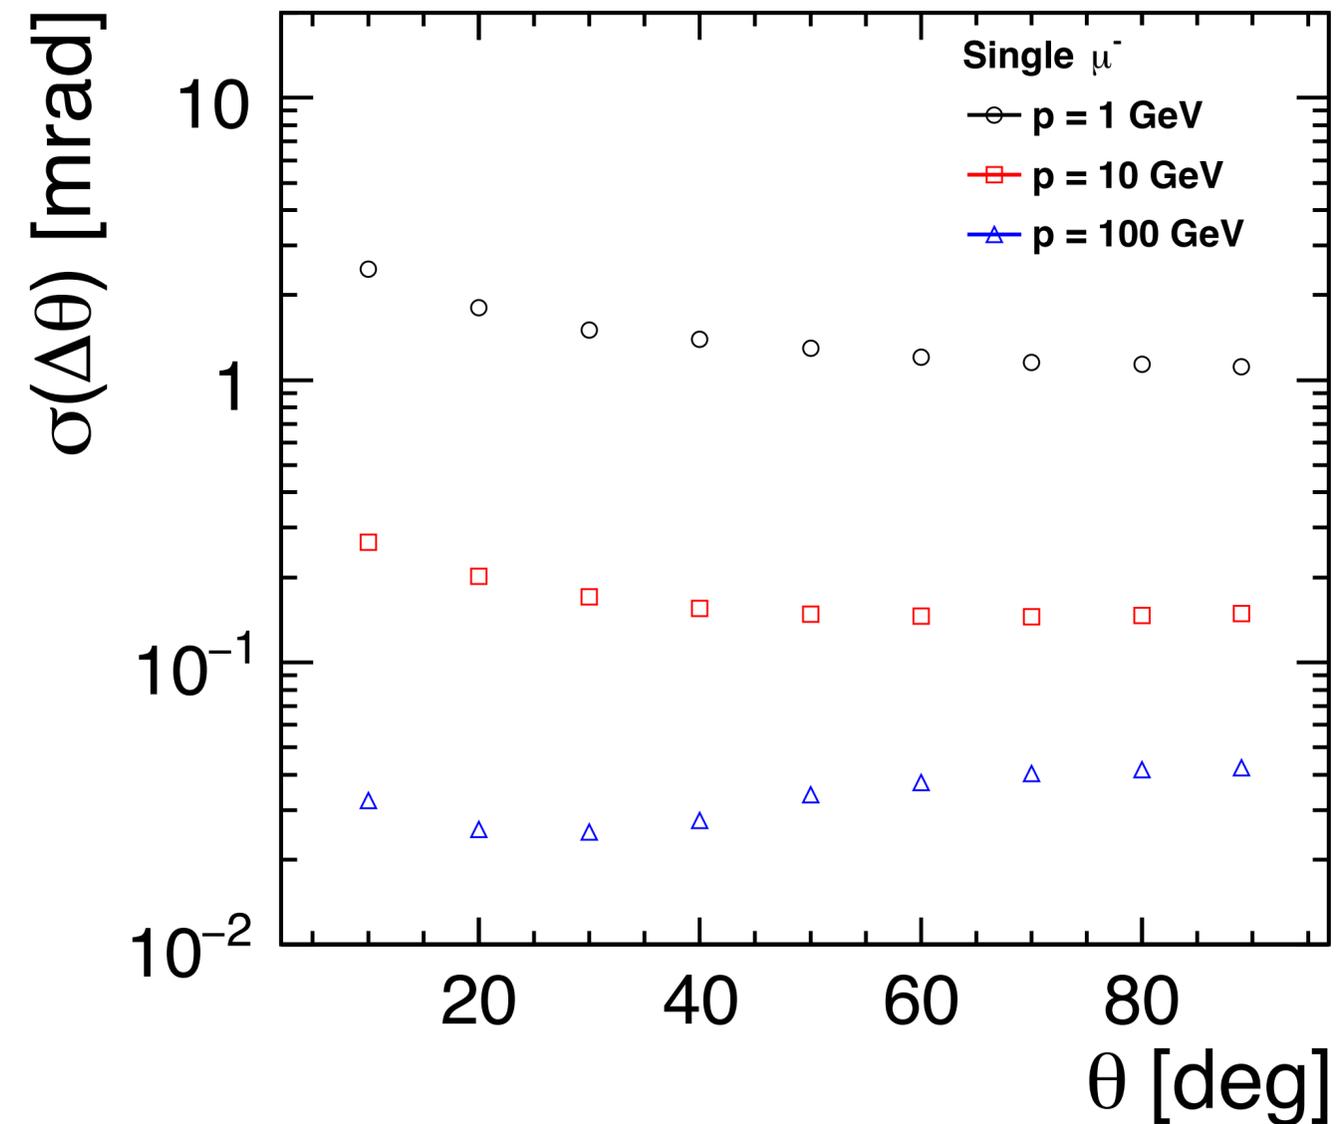

- ◆ Resolution =  $\sigma$  of the Gaussian fit of distribution (reco - true)
- ◆ Statistics used: 10k muons at fixed energy and  $\theta$  for each datapoint

★ Achieved transverse impact parameter resolution **below  $2\mu\text{m}$**  and longitudinal impact parameter resolution  **$\sim 2\mu\text{m}$**  for 100GeV muons in the barrel

# Angular resolution

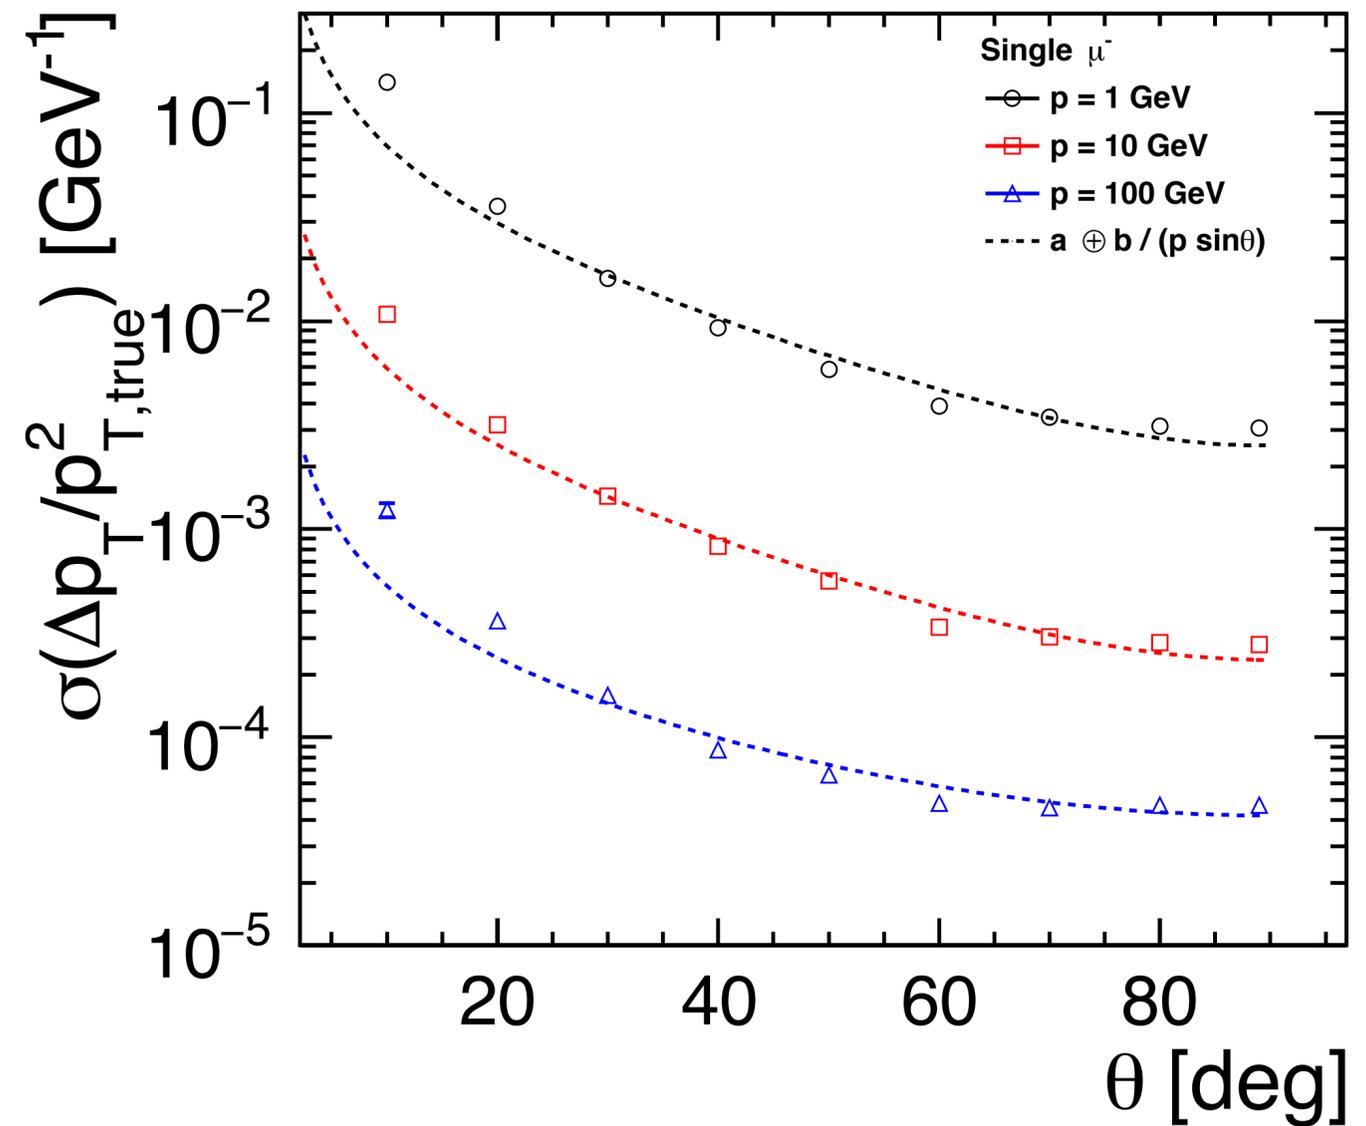

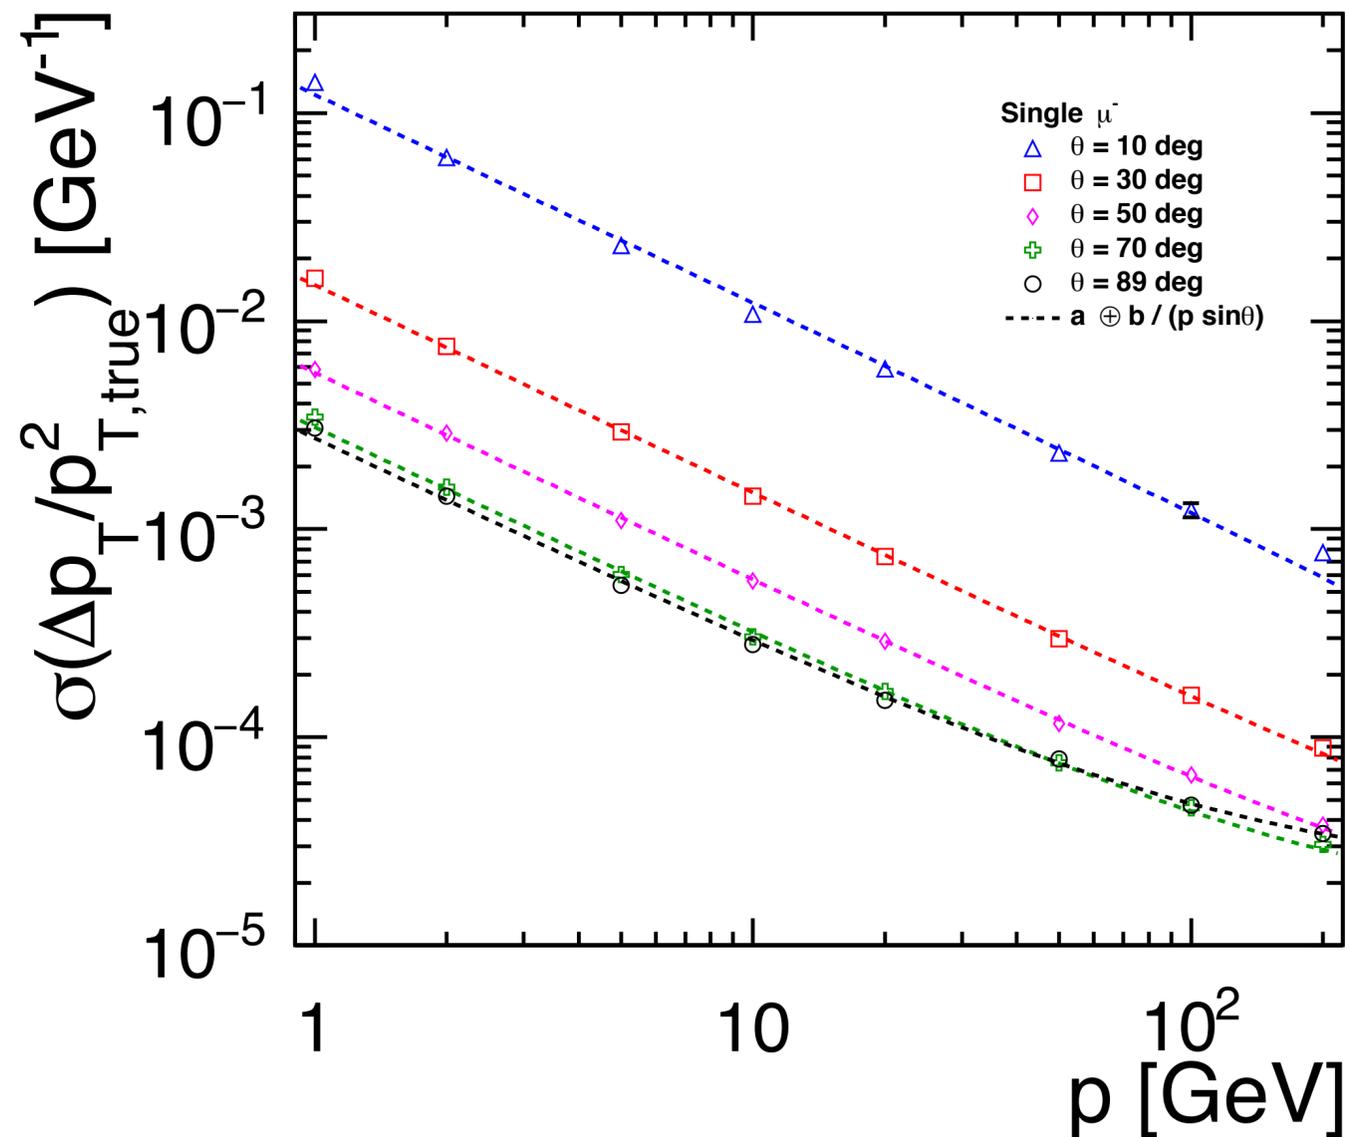

- ◆ Resolution =  $\sigma$  of the Gaussian fit of distribution (reco - true)
- ◆ Statistics used: 10k muons at fixed energy and  $\theta$  for each datapoint

★ Achieved  $\theta$  resolution of **0.04mrad** and  $\phi$  resolution  **$\sim 0.03$ mrad** for 100GeV muons in the barrel

# Momentum resolution

- ◆ Resolution =  $\sigma$  of the Gaussian fit of distribution  $(\text{reco} - \text{true})/\text{true}^2$
- ◆ Statistics used: 10k muons at fixed energy and  $\theta$  for each datapoint

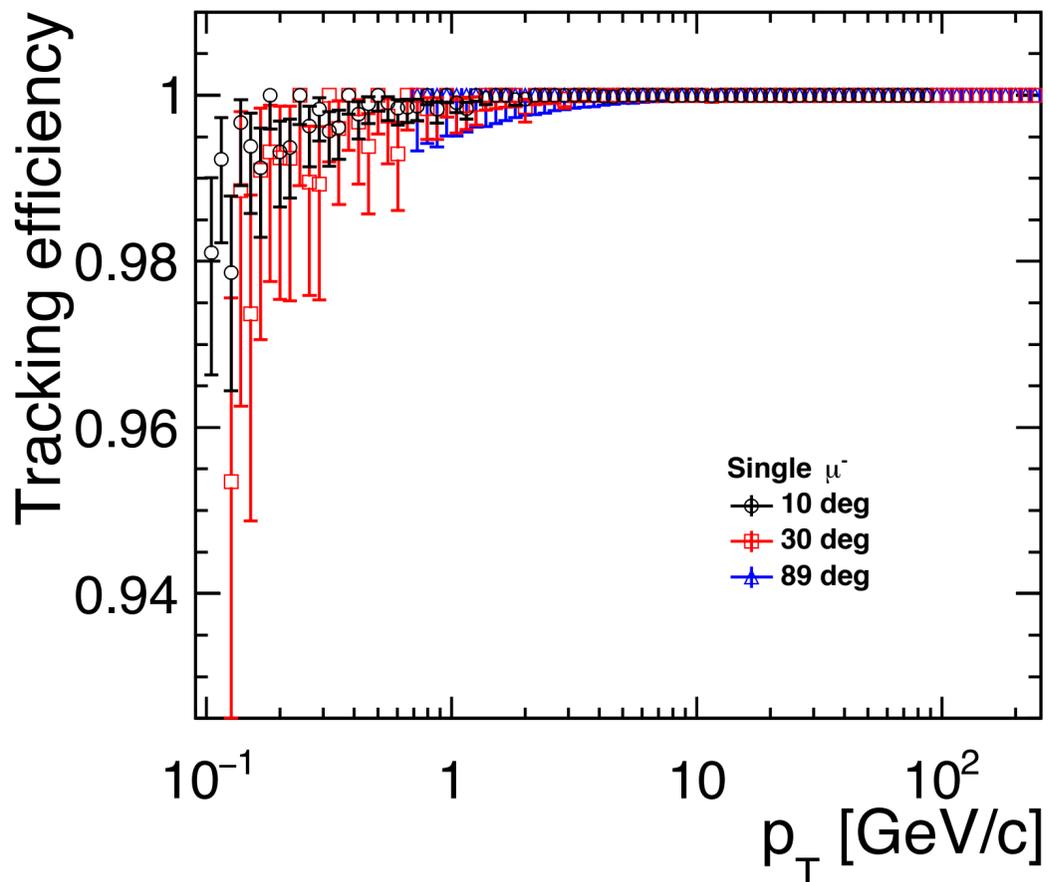

★ Achieved momentum resolution of  $4 \times 10^{-5} \text{ GeV}^{-1}$  for 100 GeV muons in the barrel

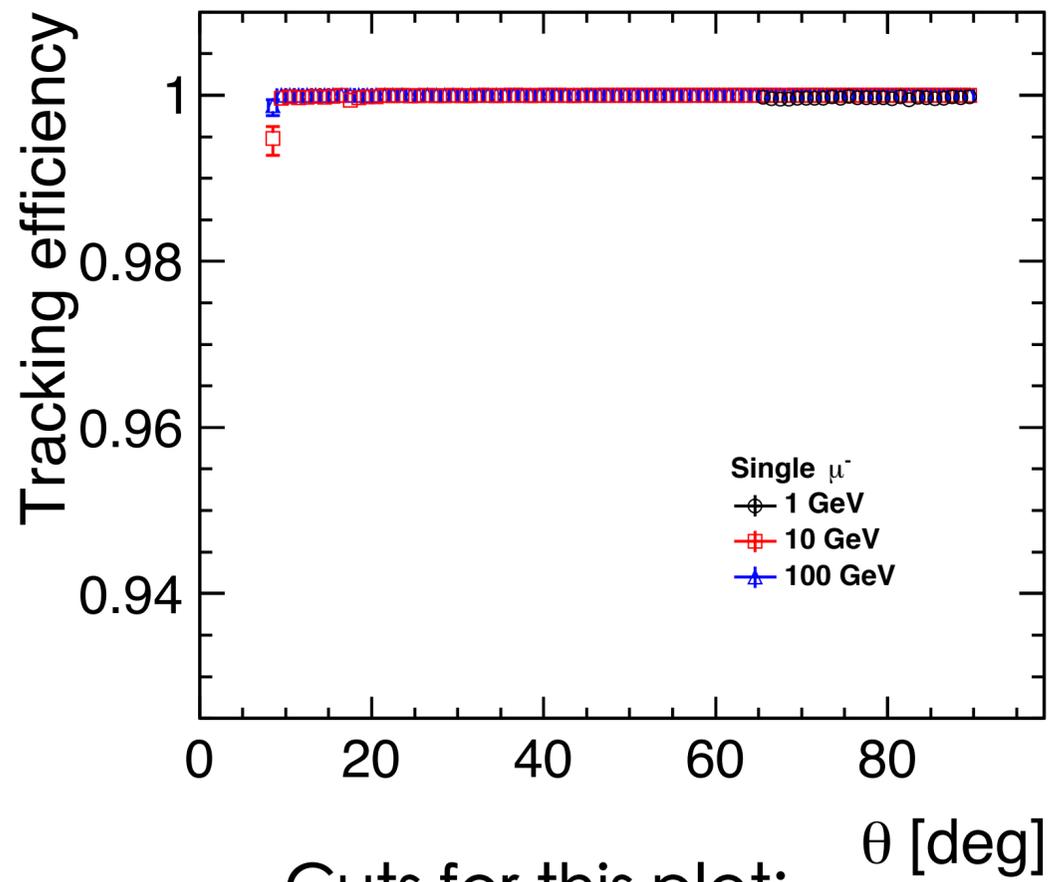

# Tracking efficiency for single muons

- ◆ Efficiency = fraction of reconstructed particles out of the **reconstructable** MC particles
- ◆ Statistics used: 2M muons for each dataset
- ◆ vs pT: fixed  $\theta$ , linear energy distribution 1-500GeV
- ◆ vs  $\theta$ : fixed energy, isotropic angular distribution 0-90deg

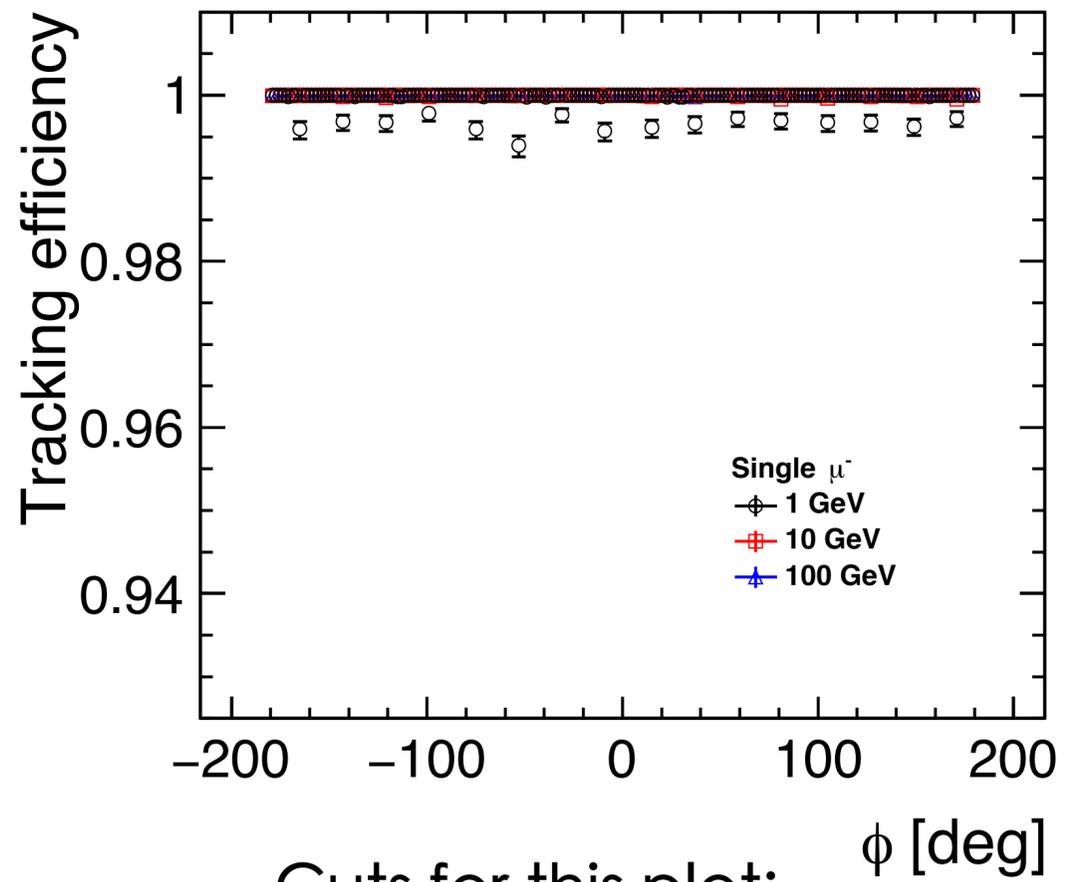

- ◆ stable
- ◆  $pT > 0.1 \text{ GeV}/c$
- ◆  $|\cos\theta| < 0.99$
- ◆ N unique hits  $\geq 4$

- Cuts for this plot:
- ◆ prompt  $\mu$

- Cuts for this plot:
- ◆ prompt  $\mu$
  - ◆  $pT > 1 \text{ GeV}/c$

- Cuts for this plot:
- ◆ prompt  $\mu$
  - ◆  $pT > 1 \text{ GeV}/c$

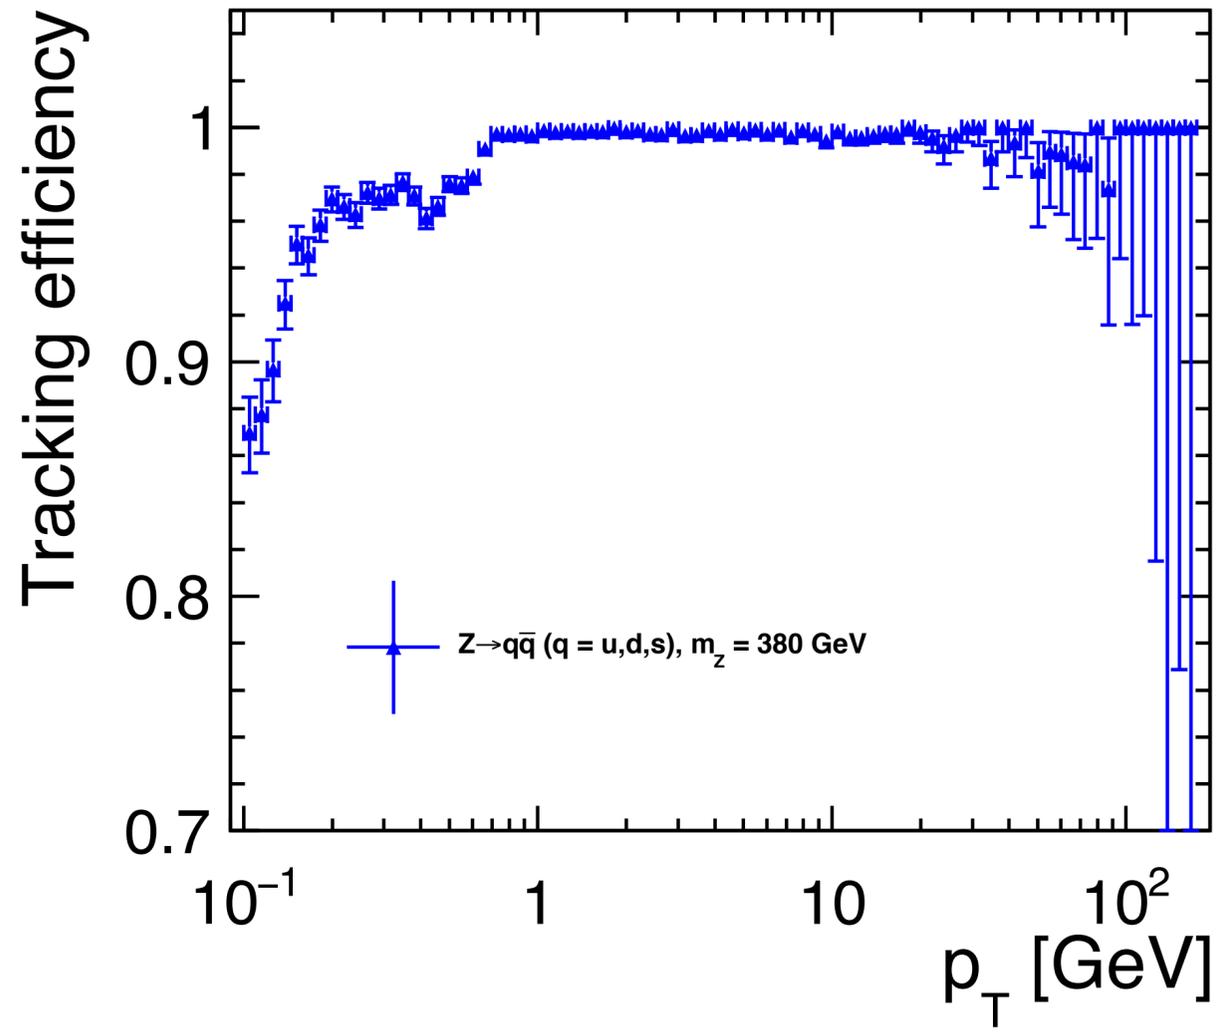

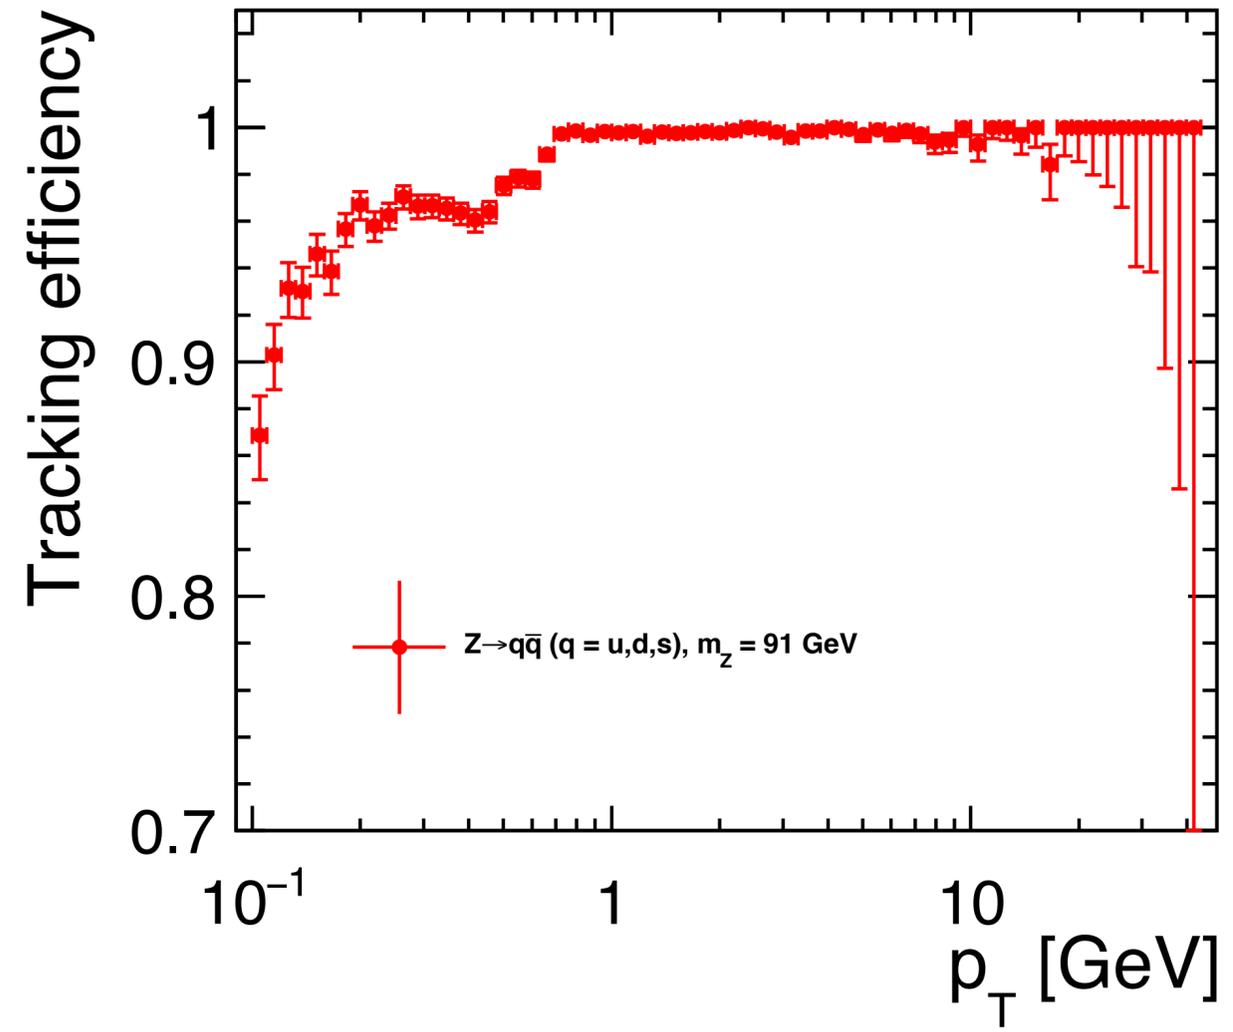

# Tracking efficiency for Z-like boson events decaying at rest into light quarks

◆ Efficiency = fraction of **pure** reconstructed particles out of the **reconstructable** MC particles

- ◆ purity  $\geq 75\%$
- ◆ purity: highest fraction of track hits belonging to the same MCparticle

- ◆ stable
- ◆  $p_T > 0.1 \text{ GeV}/c$
- ◆  $|\cos\theta| < 0.99$
- ◆ N unique hits  $\geq 4$

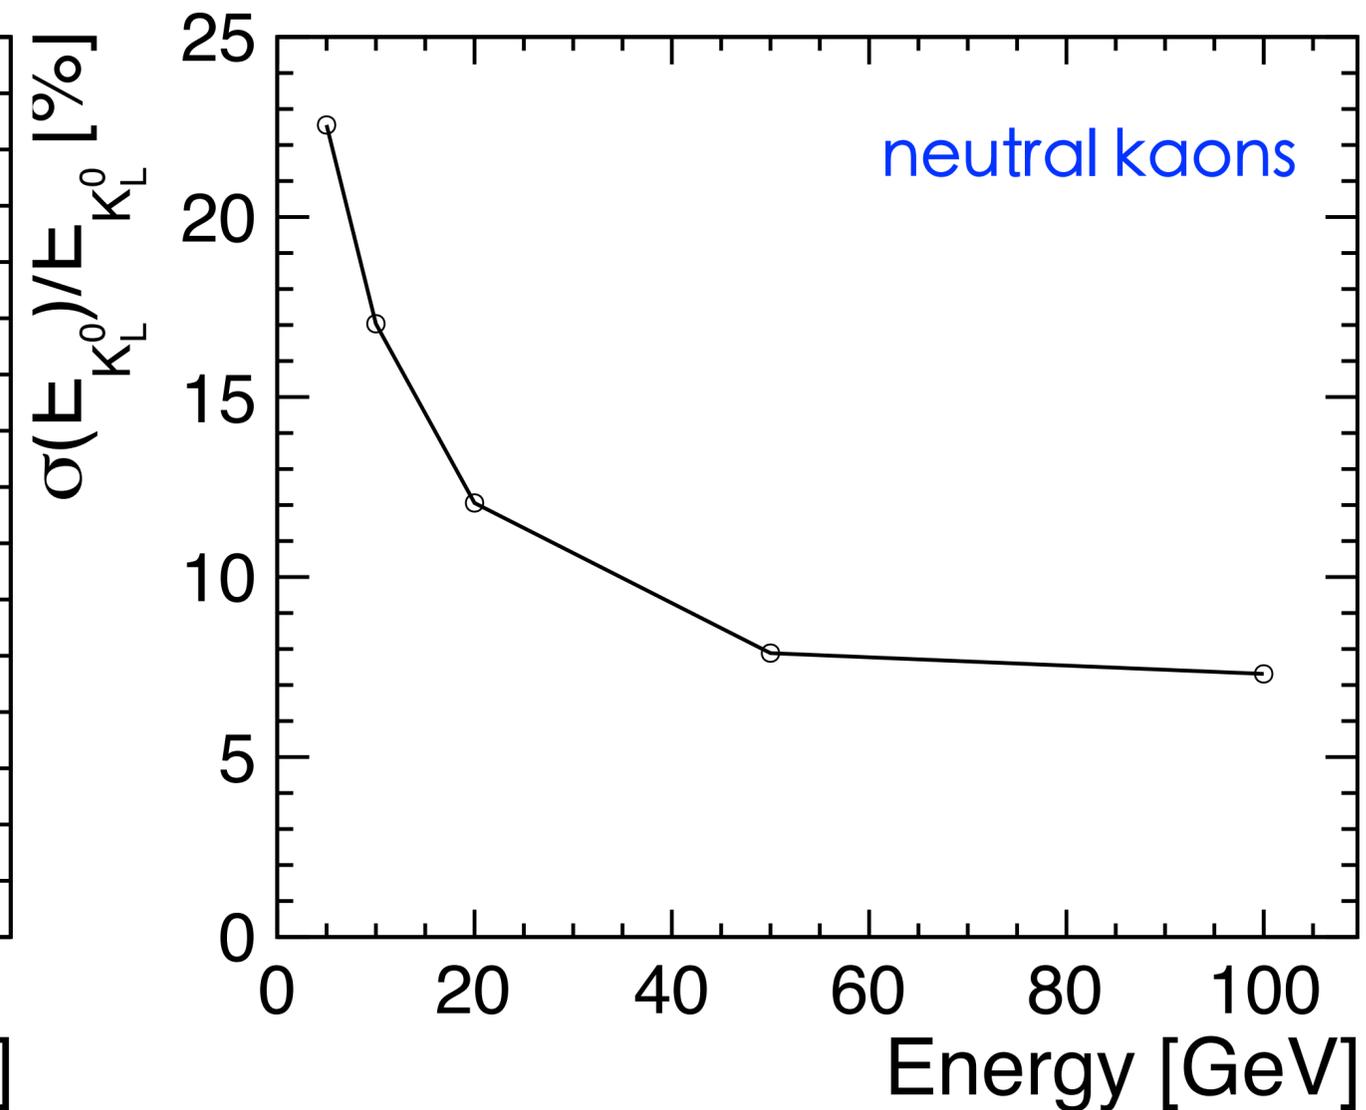

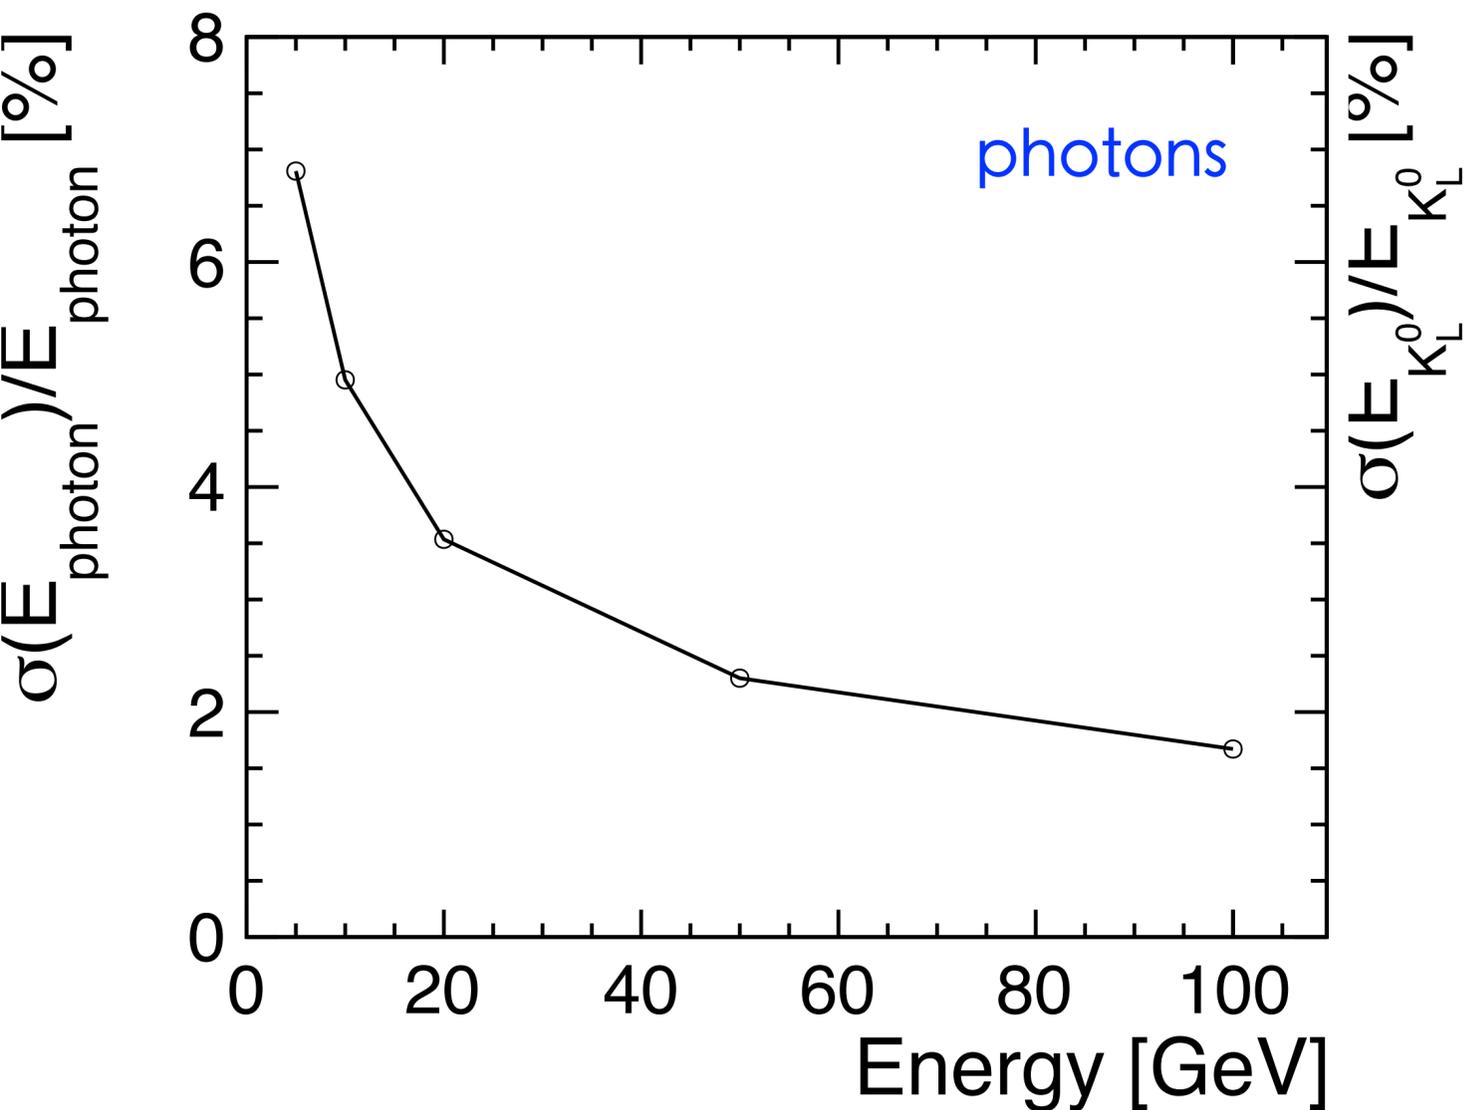

◆ Statistics used for both samples:  $\sim 4200$  events

- Cuts for both plots:
- ◆  $10 < \theta < 170 \text{ deg}$
  - ◆ vertex  $R < 50 \text{ mm}$

# Single particle energy resolution: photons and kaons

- ◆ Resolution =  $\sigma$  of the Gaussian fit of distribution (reco - true) / true
- ◆ Statistics used: 100k events per datapoint

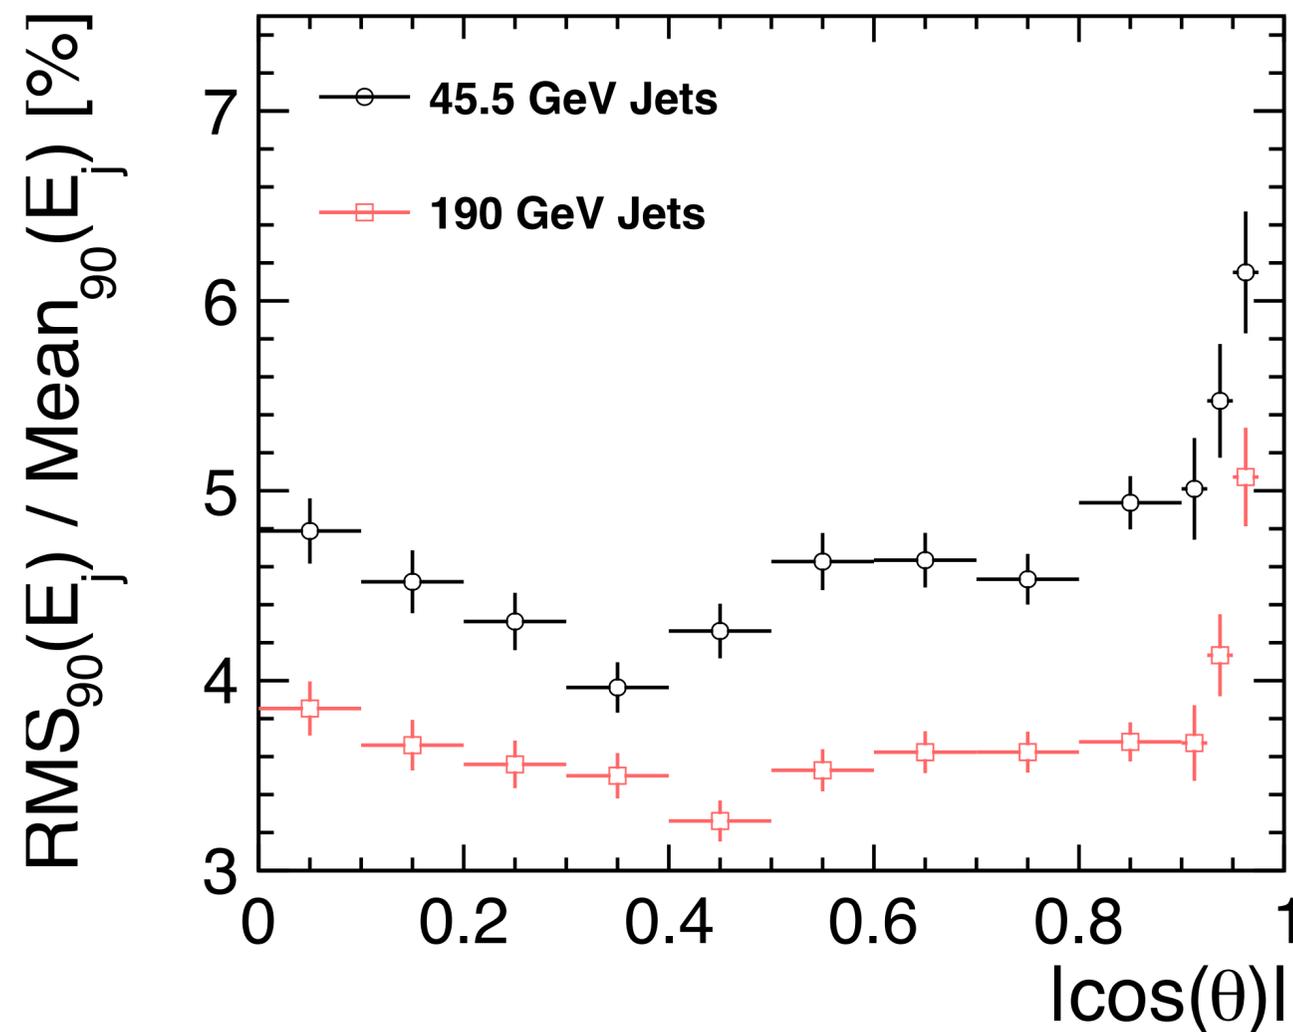

Cuts for both plots:  
◆  $60 < \theta < 120$  deg

☆ Achieved energy resolution of **1.7%** for 100GeV photons and **7.3%** for 100GeV neutral kaons

# Jet energy resolution

- Resolution per **single jet** ( $\Delta_j$ ) =  $\frac{\text{RMS}_{90}(E_j)}{\text{mean}_{90}(E_j)} = \frac{\text{RMS}_{90}(E_{jj})}{\text{mean}_{90}(E_{jj})} \sqrt{2}$   $\longrightarrow$  (no jet reconstruction at this stage)
- Statistics used: 10k Zuds events

- ☆ Jet energy resolution varies within less than 1% in the whole acceptance, except the very forward region. But this is expected due to the angular coverage
- ☆ Achieved jet energy resolution **4-5%** for 45.5GeV jets and **3-4%** for 190GeV jets for  $|\cos\theta| < 0.95$

# Single particle PID efficiency: photons

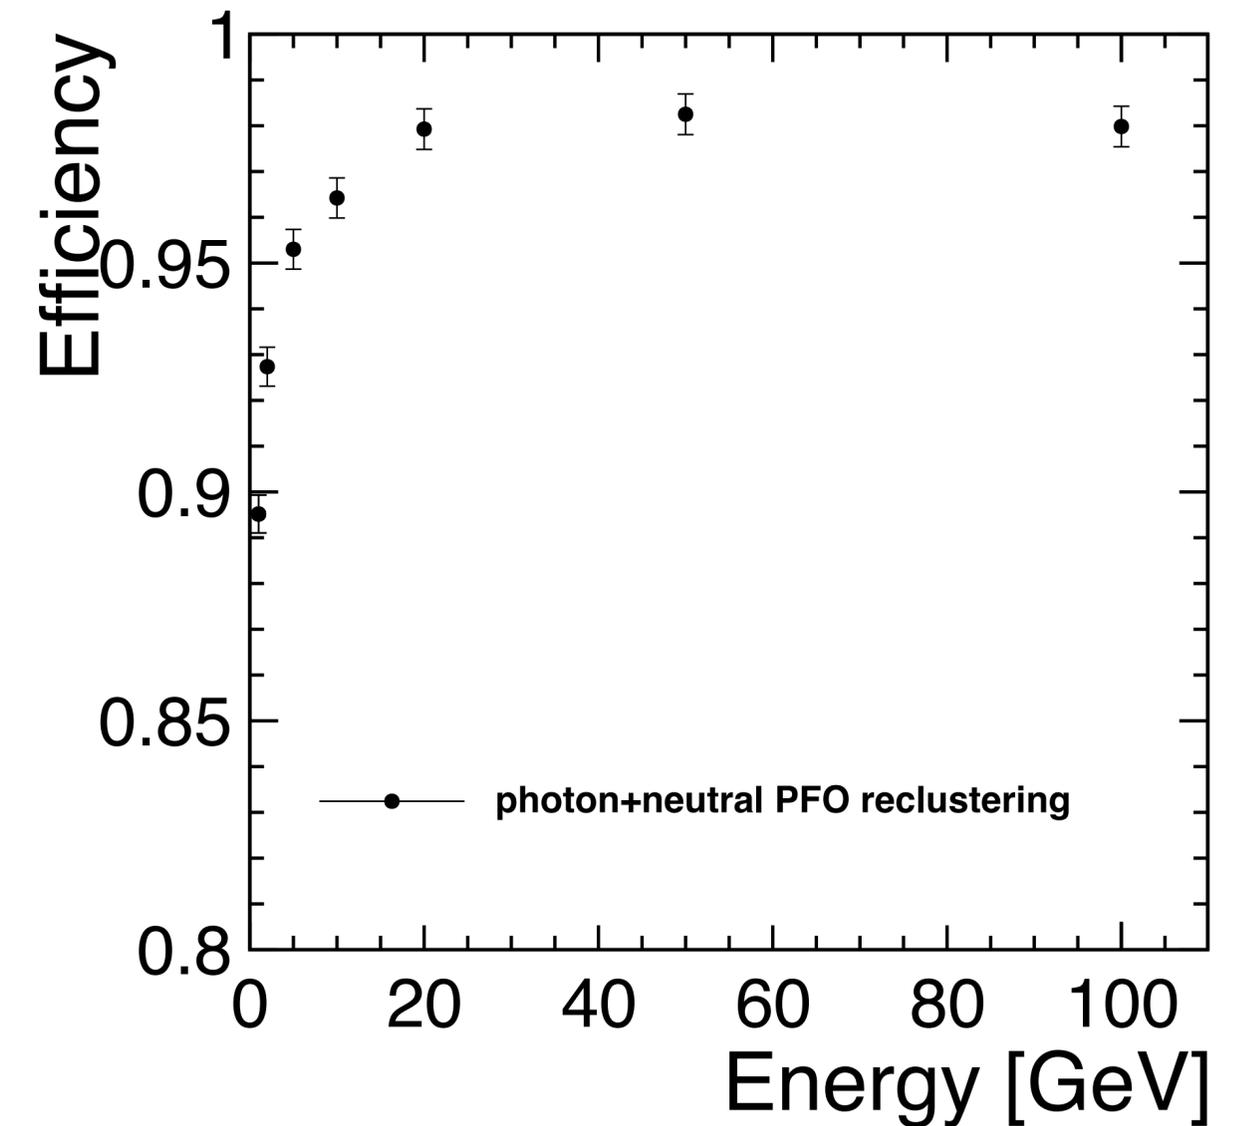

- ◆ Statistics used: 100k events for each datapoint
- ◆ particle guns with fixed energy and flat  $\cos\theta$  distribution

## ☆ Reconstructed PFO is efficient if:

- ◆ reconstructed PFO and true particle of the **same type**
- ◆ **angular matching**:  $\Delta\theta < 0.01\text{rad}$  and  $\Delta\phi < 0.02\text{rad}$ 
  - ◆ values driven by calorimeter angular resolution
- ◆ **energy matching**:  $0.75 * \text{sqrt}(E) = 5 * \sigma(\text{ECal})$

## PROBLEM: if $\geq 2$ neutral reconstructed PFOs per true particle

- ◆ no angular matching
- ◆ **RECLUSTERING**: sum of all the energies of PFOs in a cone:
  - ◆ **if neutral PFOs are photons**:  
 $\Delta\theta < 0.01\text{rad}$  and  $\Delta\phi < 0.2\text{rad}$   
(defined by looking at events where  $\gamma$  convert)
  - ◆ **else for non-photons**:  
 $\Delta\theta < 0.035\text{rad}$  and  $\Delta\phi < 0.2\text{rad}$   
(needed to recover inefficiency due to calorimeter transition region)

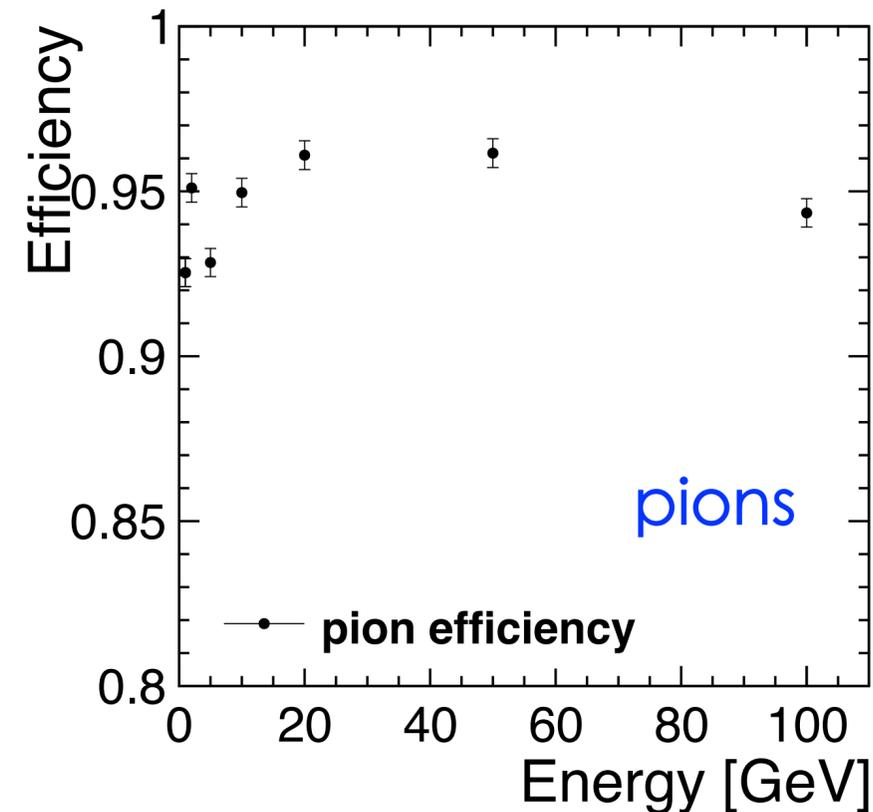

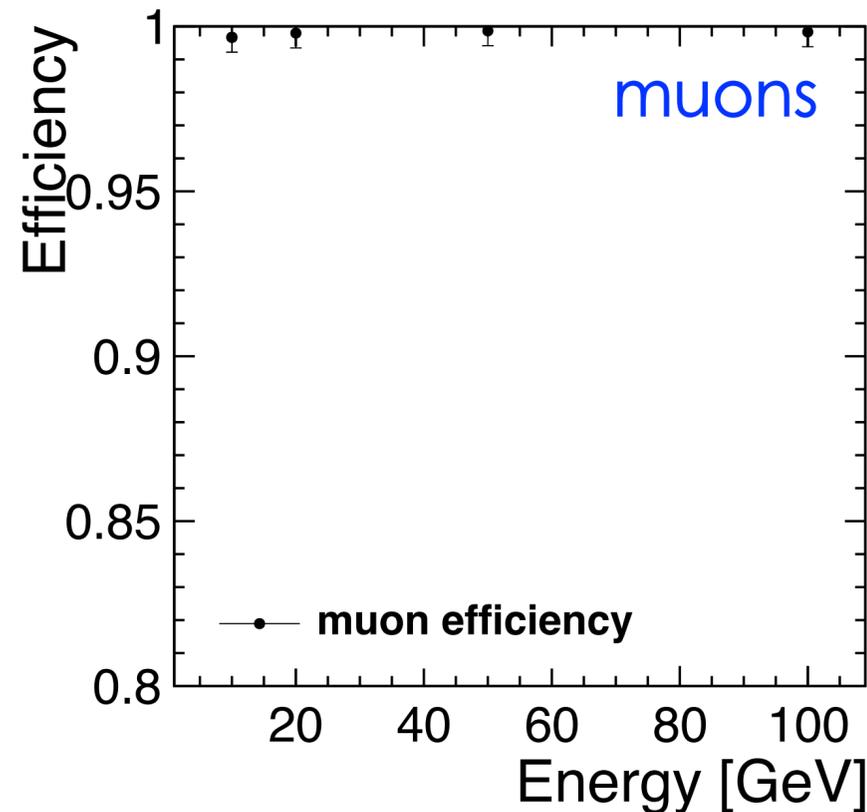

- ☆ Achieved photon PID efficiency of **98%** for energies above 20GeV

# Single particle PID efficiency: charged particles

- ◆ Statistics used: 100k events for each datapoint
  - ◆ particle guns with fixed energy and flat  $\cos\theta$  distribution

☆ Reconstructed PFO is efficient if:

- ◆ reconstructed PFO and true particle of the **same type**
- ◆ **angular matching**:  $\Delta\theta < 0.01\text{rad}$  and  $\Delta\phi < 0.02\text{rad}$ 
  - ◆ values driven by calorimeter angular resolution
- ◆ **energy matching**:  $|pT_{\text{truth}} - pT_{\text{PFO}}| < 5\% pT_{\text{truth}}$

☆ Achieved **100%** muon PID efficiency for all energies, **95%** pion above 20GeV

☆ Studies on electron PID efficiency on going (more complicated due to Bremsstrahlung)

## The CLD design is finalized for the CDR

- ☆ Overall dimensions settled
- ☆ Requirements from the MDI fulfilled
- ☆ What is missing: detailed engineering studies for the impact of the cooling systems (no power pulsing)

## Detector performances obtained in full simulation

- ☆ Tracking resolution
  - ◆ impact parameter, angles, momentum
- ☆ Tracking efficiency
  - ◆ single particles and complex events
  - ◆ what is missing: overlay of  $e^+e^-$  background and synchrotron radiation photons
- ☆ Energy resolution
  - ◆ single particles and jets
- ☆ PID efficiency
  - ◆ photons
  - ◆ charged particles

### 2 The CLD concept : Material for the Executive Summary of 3 the FCC-ee CDR

4 N.N\*

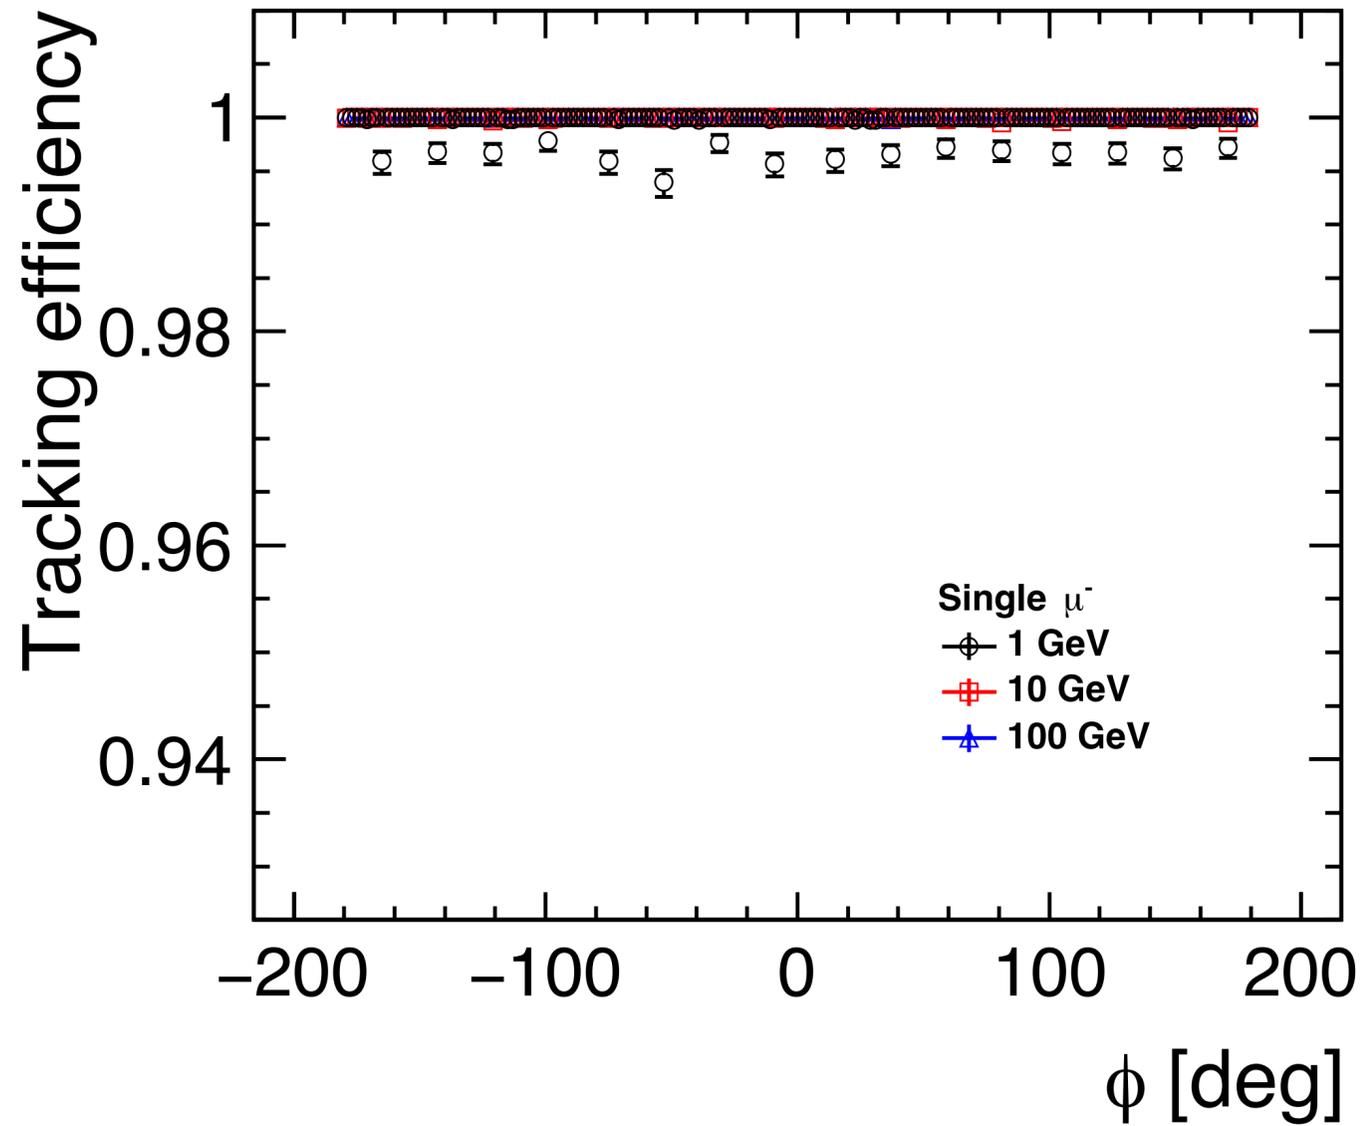

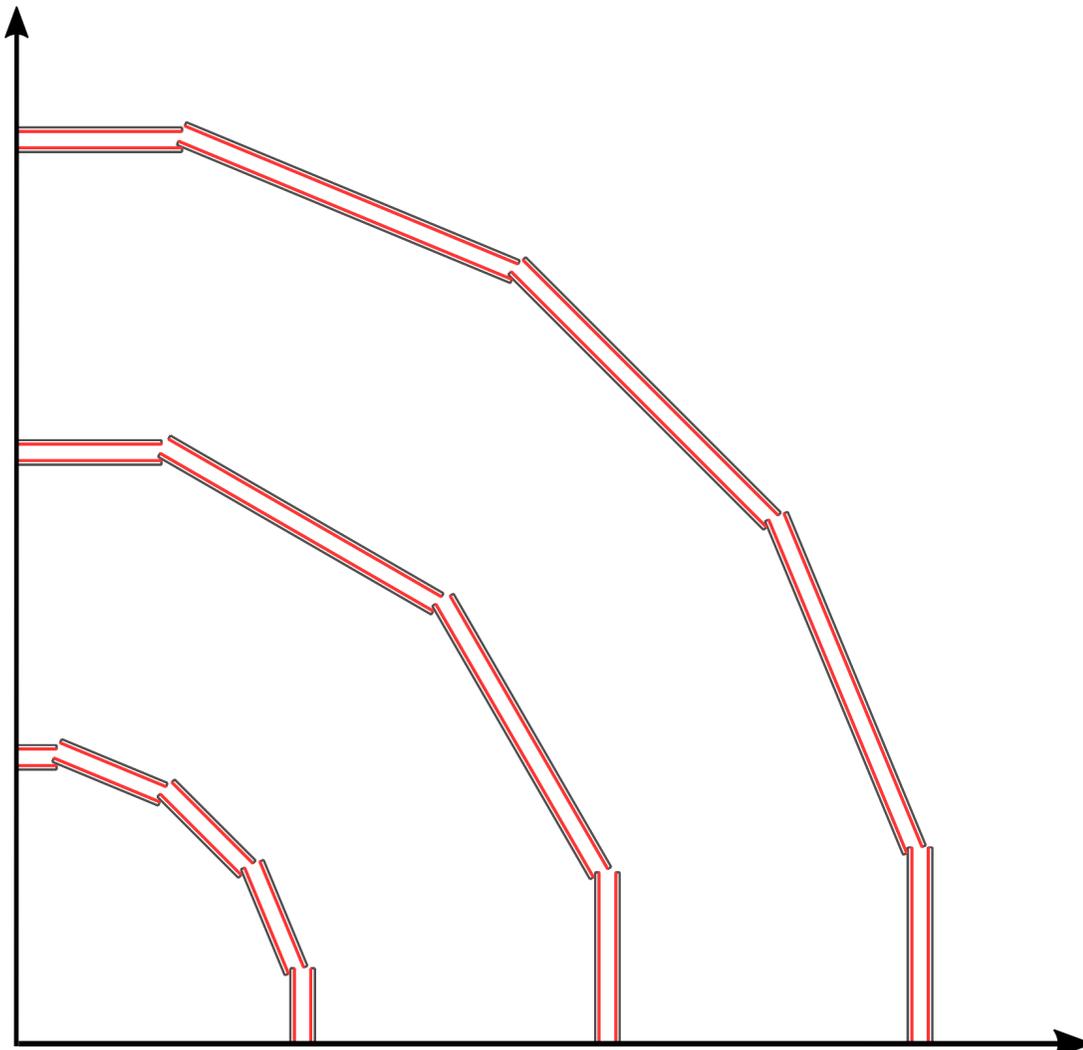

5 \* CERN, Geneva, Switzerland

#### 6 Abstract

7 This is a draft of the few pages required for the FCC-ee executive summary end of January  
8 2018.

# BACKUP SLIDES

# Single muon efficiency vs $\phi$

# Single particle PID efficiency: charged particles
