

Training and Education

- What training needed to equip the community with the right skills? (Of which Python training is usually one part.)
- What training does HEP actually need to provide "in house"? Is that training in generic aspects or on HEP specific ones?
- If generic training is needed, is this really our concern? How can we best work with other organisations and/or supplement their material? Where do the HEP specific problems lie - "how do I fit my signal in pandas?"
- Who should be giving this training? How to incentivise this properly? And share the load (it is recognised, but people can get sucked in doing too much and being type-cast). Funding sources for supporting training.
- What are the best training formats? Actual hands-on tutorials or web based resources? Curated sets of links?
- What about prerequisites? Should we require bootstrap material that trainees should have followed.
- How do we advance in the areas identified? Are there enough cycles from interested parties to help here? Can the HSF/PyHEP help make this process more efficient?
