

Physics of the W path

U. Bilow, C. Bittrich, K. Jende, M. Kobel, F. Socher

05.02.2018

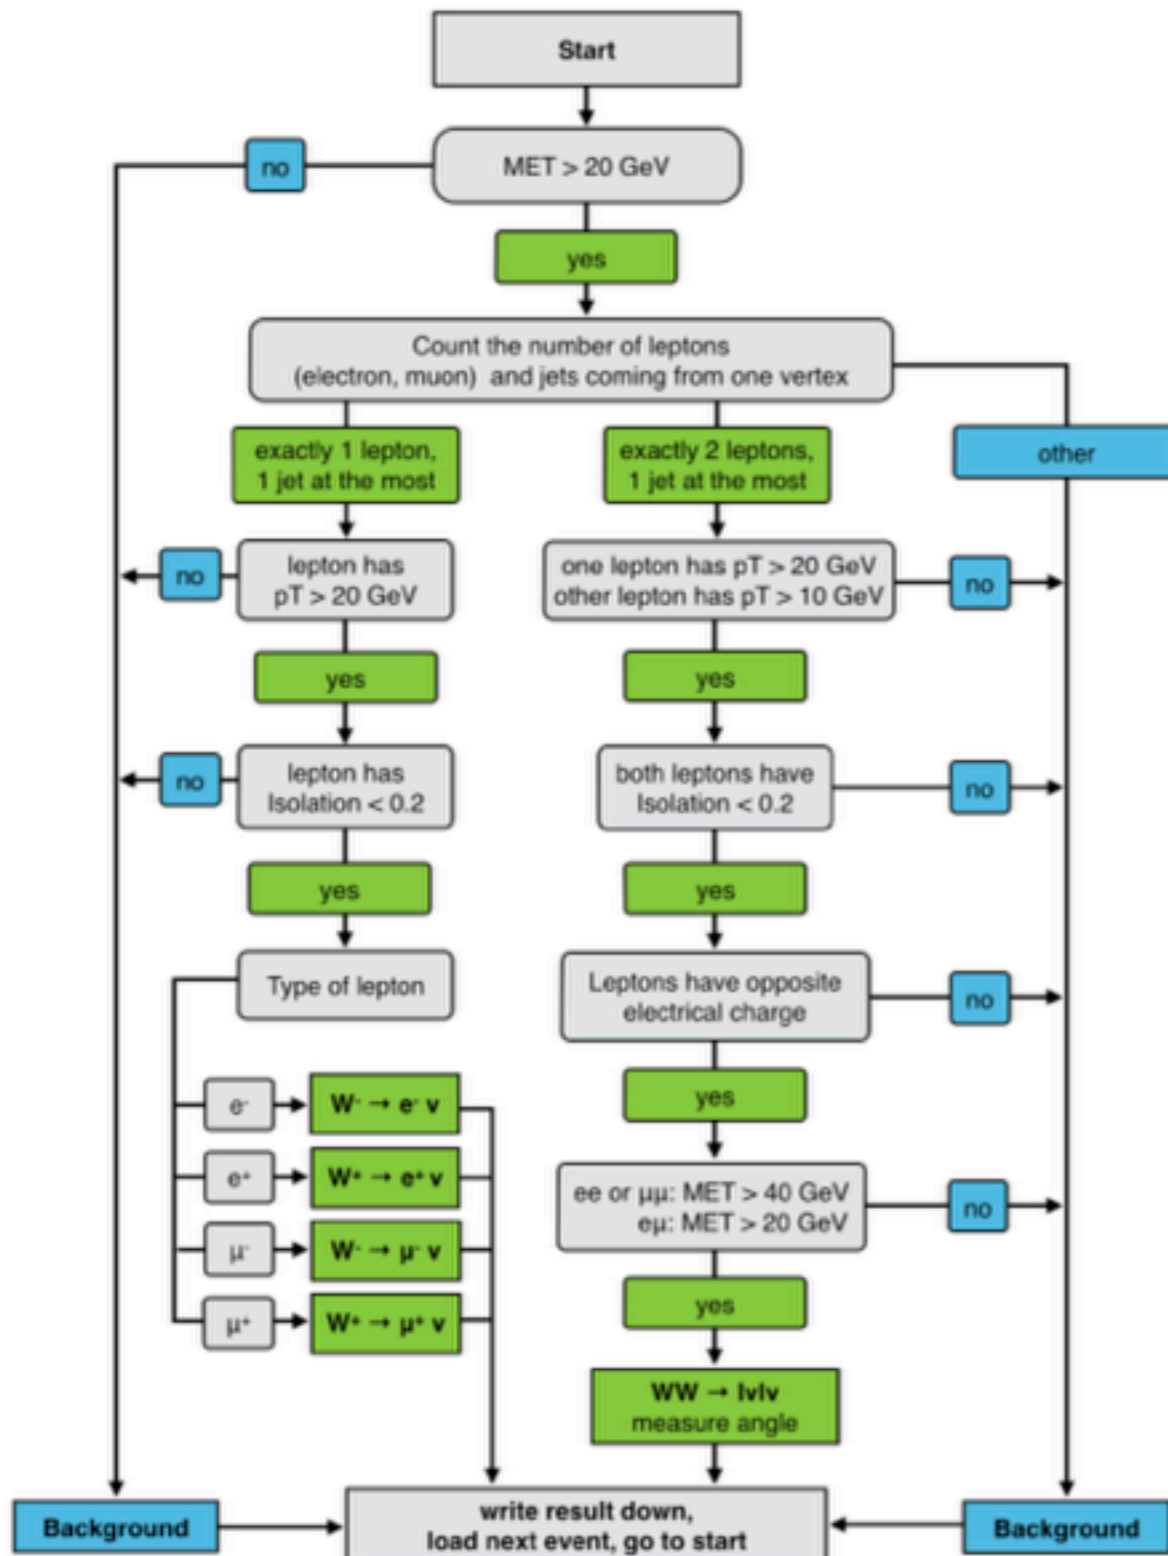

- W-path consists of two measurements:
 - W^+/W^- ratio from single W events \rightarrow determines the composition of the proton
 - search for the Higgs in WW $\rightarrow \ell\nu\ell\nu$ events
- instructions for the students:
<http://atlas.physicsmasterclasses.org/en/wpath.htm>
- two aspects will be discussed:
 - W^+/W^- ratio: how to get from the measured ratio to the composition of the proton
 - $H \rightarrow WW$ candidates: how significant is the measurement

What the students do:

- The students analyze event displays like the one on the left
- the events are categorized using a flowchart

What the students do:

- categorize each event as
 - a single W event
 - a WW event
 - background
- if the event is a single W event:
 - determine the type and charge of the lepton
- if the event is a WW candidate
 - measure the azimuthal opening angle $\Delta\phi_{\ell\ell}$
- if the event is background
 - discard

- go to: http://atlas.physicsmasterclasses.org/results/wpath_moderator.php
- this site can be reached from <http://www.atlas.physicsmasterclasses.org>
- there are two parts:
 - inner structure of the proton
 - search for the Higgs
- the drop down menus contain the dates of masterclasses, choose the date of the masterclass you are moderating:

Analysis

Inner structure of the proton: Measurement of $|W^+|/|W^-|$

Ratio	 W⁺ / W⁻ 			1.50	±	0.03

- the page will show the tables on the left
- red table shows results combined from all institutes
- blue table shows results from ATLAS
- main result in table is W⁺/W⁻ ratio
- structure of the proton should already have been discussed in each institute individually
 - step from ratio to composition of the proton is described here: http://atlas.physicsmasterclasses.org/en/wpath_auswertung.htm

Ratio	$ W^+ / W^- $			1.50	\pm	0.03

Questions to institutes:

- What was your result for the W^+/W^- ratio? How did the combination with other institutes change the total result?
- Is the result compatible with the results measured at ATLAS

Ratio	$ W^+ / W^- $			1.50	\pm	0.03

Further things to discuss:

- the datasets contain 50% single W events and 42% background, ratio is about 1.2
- the W^+/W^- ratio should be compatible with 1.5 within statistical uncertainty
- compare to ATLAS measurement \rightarrow smaller uncertainty, larger statistics
- step from ratio to composition of the proton is described here:
http://atlas.physicsmasterclasses.org/en/wpath_auswertung.htm

WW-Histogramme

	bin 1	bin 2	bin 3	bin 4	bin 5	bin 6	bin 7	bin 8	bin 9	bin 10	SUM
N	5	3	2	1	2	2	3	7	5	9	39
B	1.5	2.2	2.2	2.4	3.2	3.2	3.8	4.6	5.6	6	34.7
S	3.5	0.8	-0.2	-1.4	-1.2	-1.2	-0.8	2.4	-0.6	3	4.3
Z	2.8	0.5	-0.1	-0.9	-0.7	-0.7	-0.4	1.1	-0.2	1.2	0.7

- the results for $H \rightarrow WW$ are discussed via this histogram
- Options:
 - number of bins can be set
 - histogram normalization (standardization)
 - 1: normalized to expected number of WW candidates in analyzed data
 - 2: normalized to number of found WW candidates
 - 3: normalized to number of WW candidates found with $\Delta\phi_{\ell\ell} \geq 115^\circ$
 - Higgs contribution can be toggled on or off

number of bins [1 ... 20]

S	3.5	0.8	-0.2	-1.4	-1.2	-1.2	-0.8	2.4	-0.6	3	4.3
Z	2.8	0.5	-0.1	-0.9	-0.7	-0.7	-0.4	1.1	-0.2	1.2	0.7

Questions to institutes:

- What exactly do the black data points mean?
- How would you interpret the blue and green areas? What do they mean?

After turning on the Higgs contribution:

- Can you claim a Higgs discovery? What would be necessary to claim a discovery?
