TMVA in the Future

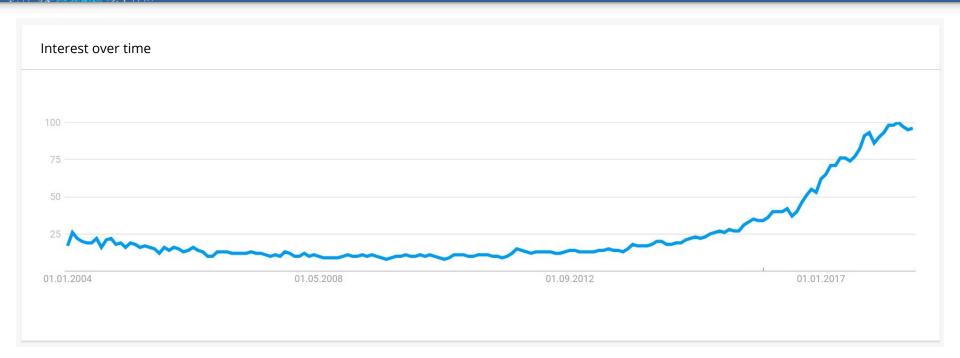

Adapting to the Modern Machine-Learning Landscape

Stefan Wunsch (stefan.wunsch@cern.ch) for the ROOT team

What has changed?

Popularity of the term "machine learning" on Google

The machine-learning workflow

Events of physics processes

Energy deposits in detector cells

. . .

Transport data from physical device (HDD, file server, ...) to your environment (Python runtime, ...) Fit the free parameters of your model to data (weights of a NN, cuts defining trees in a BDT, ...)

Apply trained model to new data (trigger, event classification, jet tagging, ...)

Collect data

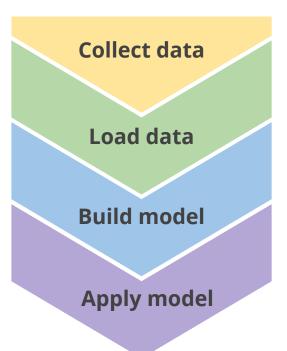

Load data

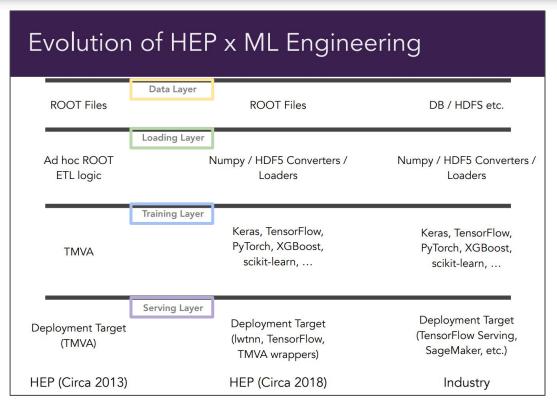

Build model

Apply model

Evolution of the ML landscape

"Overview of ML in HEP" by Luke De Oliveira at the 2nd IML workshop in April 2018

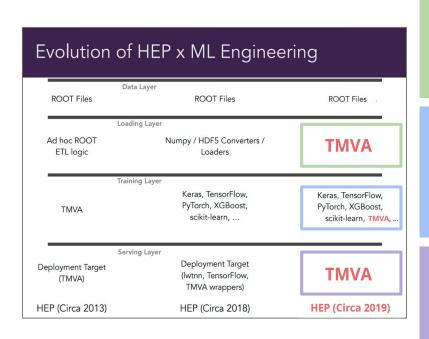

Our vision for TMVA

Evolution of HEP x ML Engineering		
ROOT Files	Data Layer ROOT Files	ROOT Files
Ad hoc ROOT ETL logic	Loading Layer Numpy / HDF5 Converters / Loaders	TMVA
TMVA	Training Layer Keras, TensorFlow, PyTorch, XGBoost, scikit-learn,	Keras, TensorFlow, PyTorch, XGBoost, scikit-learn, TMVA ,
Deployment Target (TMVA)	Serving Layer Deployment Target (lwtnn, TensorFlow, TMVA wrappers)	TMVA
HEP (Circa 2013)	HEP (Circa 2018)	HEP (Circa 2019)

TMVA in the future **≡** Glue between HEP and ML

Key ingredients

Load data

- Load data from many sources
- Filter data
- Define new variables
- Access data easily from Python

Build model

- Solid baseline of ML methods
- Integration of (cutting-edge)
 external ML packages
- Mix-and-match between packages

Apply model

- High throughput inference
- Fully accessible from C++
- Plug-and-play for different models

Loading data with RDataFrame

Load data

- Load data from many sources
- Filter data
- Define new variables
- Access data easily from Python
- **Key tool:** ROOT dataframes
- Sources:
 - ROOT
 - CSV
 - Arrow
 - (xAOD)
 - (SQLite)
- Remote file access:
 - xRootD
 - Davix

```
import ROOT
# Read a remote ROOT file via http
df = ROOT.RDataFrame(
  "Events".
  "http://root.cern.ch/files/NanoAOD_DoubleMuon_CMS2011OpenData.root"
# Reduce on the desired events
df_reduced = df.Filter("nMuon>=2")
# Define needed variables
df_newvar = df_reduced.Define("Muon_pt_leading", "Sorted(Muon_pt)[0]"
# Access data as numpy array
data = df_newvar.AsNumpy()
# Feed to any ML package
import awesome_ml
model = awesome_ml.Model()
model.fit(data)
```

Enrico's talk about declarative analysis in ROOT,

Kim's talk about integration of ROOT dataframes

ROOT

Available in

On the way ...

Memory adoption of data from C++ containers with numpy arrays

```
import ROOT
import numpy

# Standard vector from C++ side of the application
x = ROOT.std.vector("float")((1, 2, 3))

# View on data as numpy array via memory adoption (zero copy)
numpy_array = numpy.asarray(x)
```

Read flat TTree as numpy.array

```
import ROOT

# Open remote file via http
file = ROOT.TFile.Open("http://root.cern.ch/files/tmva_class_example.root")

# Get tree with data
tree = file.Get("TreeS")

# Read data in tree as numpy.array
numpy_array = tree.AsMatrix(["var1", "var2", "var3", "var4"])
```

Enric's talk about PyROOT

ROOT PPP meeting:
Talk about memory adoption
with numpy

Building ML models

Build model

- Solid baseline of ML methods
- Integration of (cutting-edge)
 external ML packages
- Mix-and-match between packages
- ▶ **ML baseline:** Methods of current TMVA
- Key points:
 - Modern interface
 - Modularity
 - Interoperability with numpy ≡
 Interoperability with external ML packages

```
import ROOT
import numpy as np
# Read a ROOT file
df = ROOT.RDataFrame("tree", "file.root")
# Access data as numpy arrays and build training dataset
x_sig = df.Filter("a>b && c!=d").AsNumpy()
x_bkg = df.Filter("e+f==g && h==i").AsNumpy()
x = numpy.stack([x_sig, x_bkg])
y = numpy.stack([np.ones(len(x_sig)), np.zeros(len(x_bkg)])
# Build TMVA model
bdt = ROOT.TMVA.BDT(num_trees=500, depth=3)
bdt.Fit(x, y)
bdt.Save("parameters.root")
# Build sklearn model
from sklearn.ensemble import RandomForestClassifier
rf = RandomForestClassifier()
rf.fit(x, y)
```

On the way ...

C++ container for multi-dimensional arrays

C++

```
#include "R00T/RTensor.hpp"
RTensor<float> x({2, 2});
x(0,0) = 1;
x(1,1) = 1;
cout << x << endl;
// Returns:
// { {1, 0},
// {0, 1} }
```

Python

- Key feature for
 - design of modern C++ interfaces for ML, e.g., for batches or image data as input
 - interoperability with numpy as C++-side object

ROOT PPP meeting: RTensor proposal talk

Apply trained ML model

Apply model

- High throughput inference
- Fully accessible from C++
- Plug-and-play for different models

Key points:

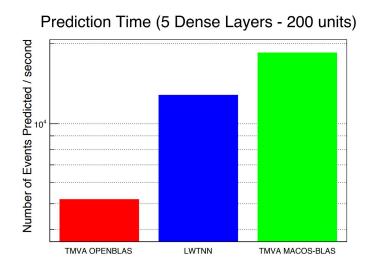

- Fast inference,
 especially event-by-event
- Being accessible from C++
- Loading parameters of externally trained models
- Interaction with RDataFrame

```
int main() {
 // Load TMVA and models trained with external packages
 auto bdt = ROOT::TMVA::BDT("parameters.root");
 auto nn = ROOT::TMVA::Keras("parameters.h5");
 // Perform single prediction
 vector<float> x = \{1.0, 2.0, 3.0, 4.0\};
 vector<float> y = bdt.Predict(x);
 // Append method responses to a ROOT dataframe
 auto df = ROOT::RDataFrame("events", "some_file.root");
 vector<string> vars = {"var1", "var2", "var3", "var4"};
 auto df_response = df.Define("response_bdt", bdt, vars)
                       .Define("response_nn", nn, vars);
 // Analyze the result
 auto h_bdt = df_response.Filter("response_bdt>0.5")
                          .Histo1D("mass");
 auto h_nn = df_response.Filter("response_nn>0.5")
                         .Histo1D("mass");
 h_bdt.Draw("histo");
 n_nn.Draw("same");
```

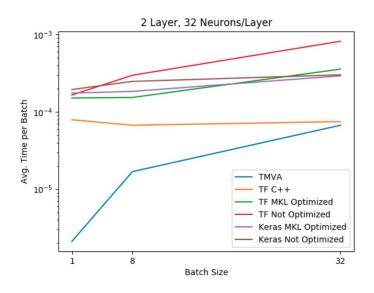

On the way ...

Fast event-by-event inference with TMVA's neural network implementation

CHEP talk by Kim Albertsson,

Lorenzo's talk about TMVA

Work by Alexandru Burlacu

Summary

TMVA in the future **≡** Glue between HEP and ML

Interoperability with numpy

ROOT dataframe support

Modern C++ interfaces

Active support of external packages

High-throughput inference

Modular features

Sustainable baseline of ML methods
