

# ***Experiments at the LHC***

**EIROforum Teacher School  
November 17 2009**

**Christoph Rembser (CERN)**

# The 4 LHC Experiments

# High Energy Physics Experiments

- **Goal: understand “rules” of nature:**
  - How do particles interact
  - How are particles produced, how they decay...

**Somewhat similar:**

**Understand “rules” for football by analysing photos**

• **good camera allows to see details**

• **when taking many pictures, rare “events” can be studied**

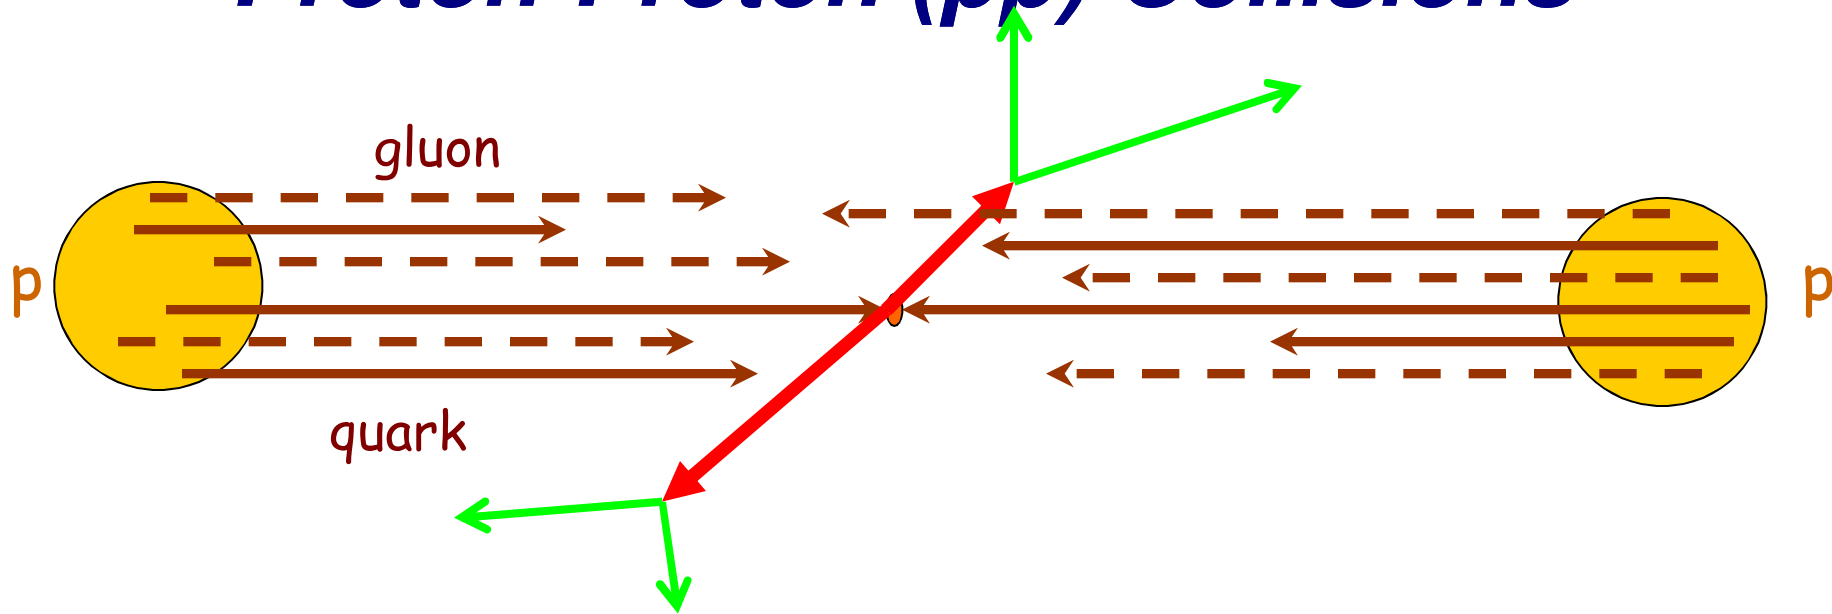

# ***The LHC “Experiments”***

**Better: the LHC experiment, consisting of**

- **The Large Hadron Collider (see talk by D.Brandt)**
  - Provides particle (Proton) beams which collide at four interaction points
- **The four cameras taking pictures of the collisions**
  - Around the four interaction points, four cameras are installed, the **LHC detectors**
    - ALICE, LHCb, CMS and ATLAS
    - Huge permanent installations, taking photos 24h/7d for >10 years
- **This talk (a personally biased selection)**
  - Overview on LHC detector(s)
  - Highlights of physics analyses

# Proton-Proton (pp) Collisions

- **At interaction point, collision of one (sometimes more) protons**
  - Only constituents of the proton, the quarks, collide!
  - $E=mc^2$  : “new” particles can be produced!
  - Produced particles or their decay products fly away from the interaction point
- **Cameras (the detectors) take a photo of this event**
  - 30 million pictures per second!

# Proton-Proton (pp) Collisions

- $E=mc^2$  : “new” particles can be produced!
- Produced particles or their decay products fly away from the interaction point
- **Cameras (the detectors) take a photo of this event**
  - 30 million pictures per second!

# “Old” Detectors: Bubble Chambers

Vessel filled with superheated transparent liquid. Electrically charged particles leave “traces, like condensation trails by airplanes. Beautiful pictures!

A bubble chamber

“Scanning girl” analysing bubble chamber photos.

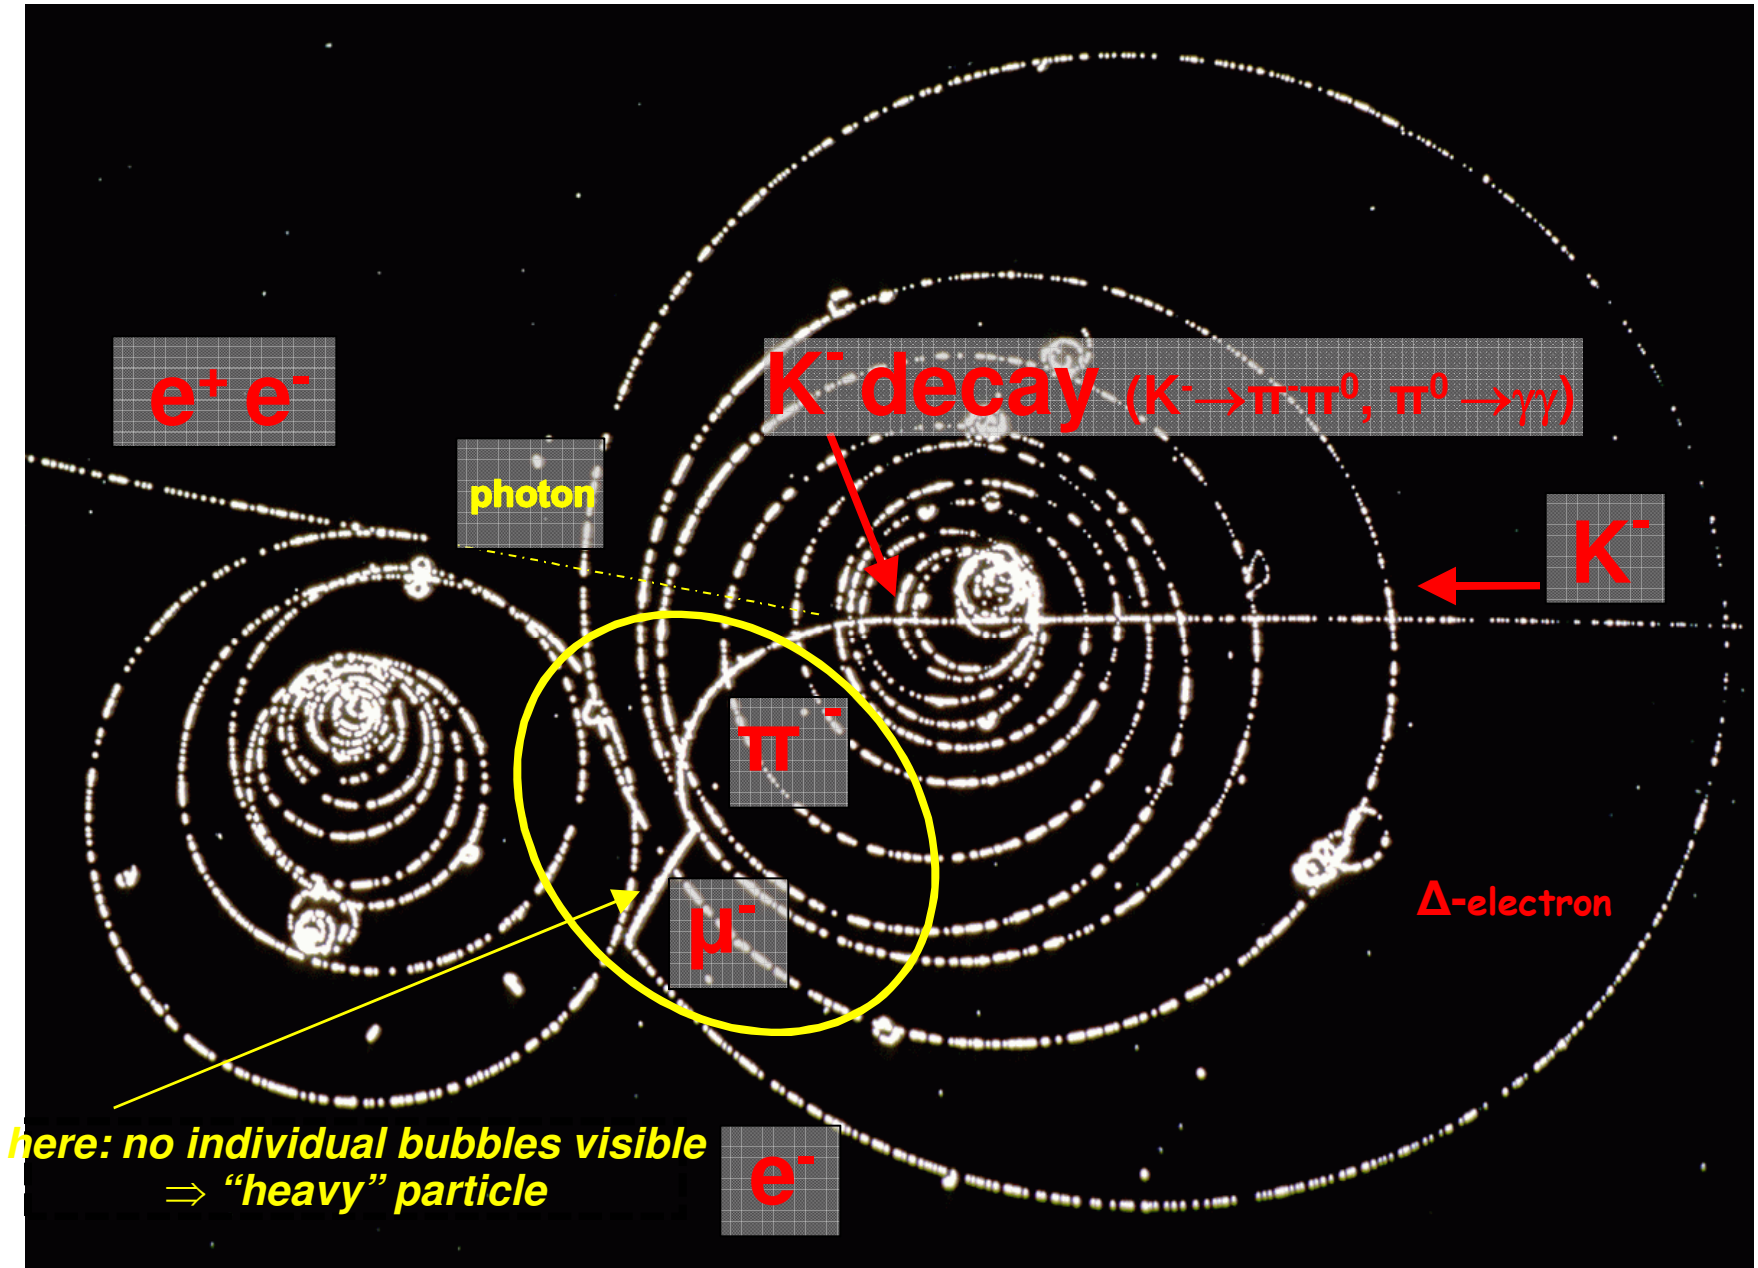

“Scanning table” (1972)

# Bubble Chamber Pictures

# Bubble Chamber Pictures

$e^+ e^-$

photon

$K^-$  decay ( $K^- \rightarrow \pi^- \pi^0, \pi^0 \rightarrow \gamma\gamma$ )

$K^-$

$\pi^-$

$\mu^-$

$\Delta$ -electron

$e^-$

here: no individual bubbles visible  $\Rightarrow$  "heavy" particle

# An LHC Detector (ATLAS)

0012146\_2608/97

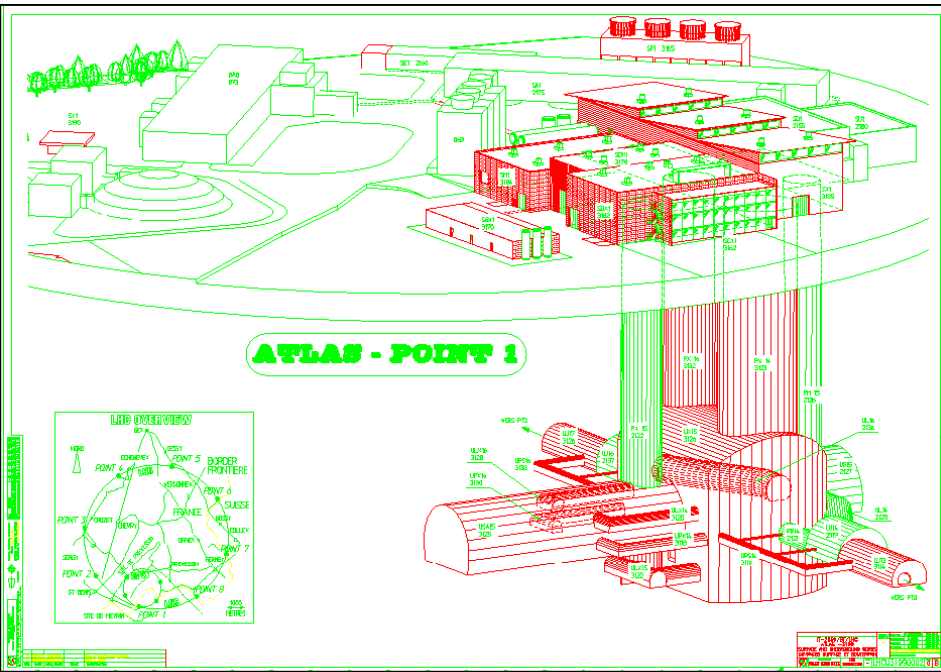

**A Physicist...**

# Detector Layers – Different “Camera Types for different Particles

# Detectors are huge!!!!

Huge underground hall +  
many buildings on surface  
2 access shafts 18m + 12m Ø,  
2 smaller shafts for elevator and stair

ATLAS Detector  
"superimposed" onto the  
building where this meeting  
takes place

Length = 55 m  
Width = 32 m  
Height = 35 m

*ATLAS  
Cavern*

# *It's fun building detectors!!!!*

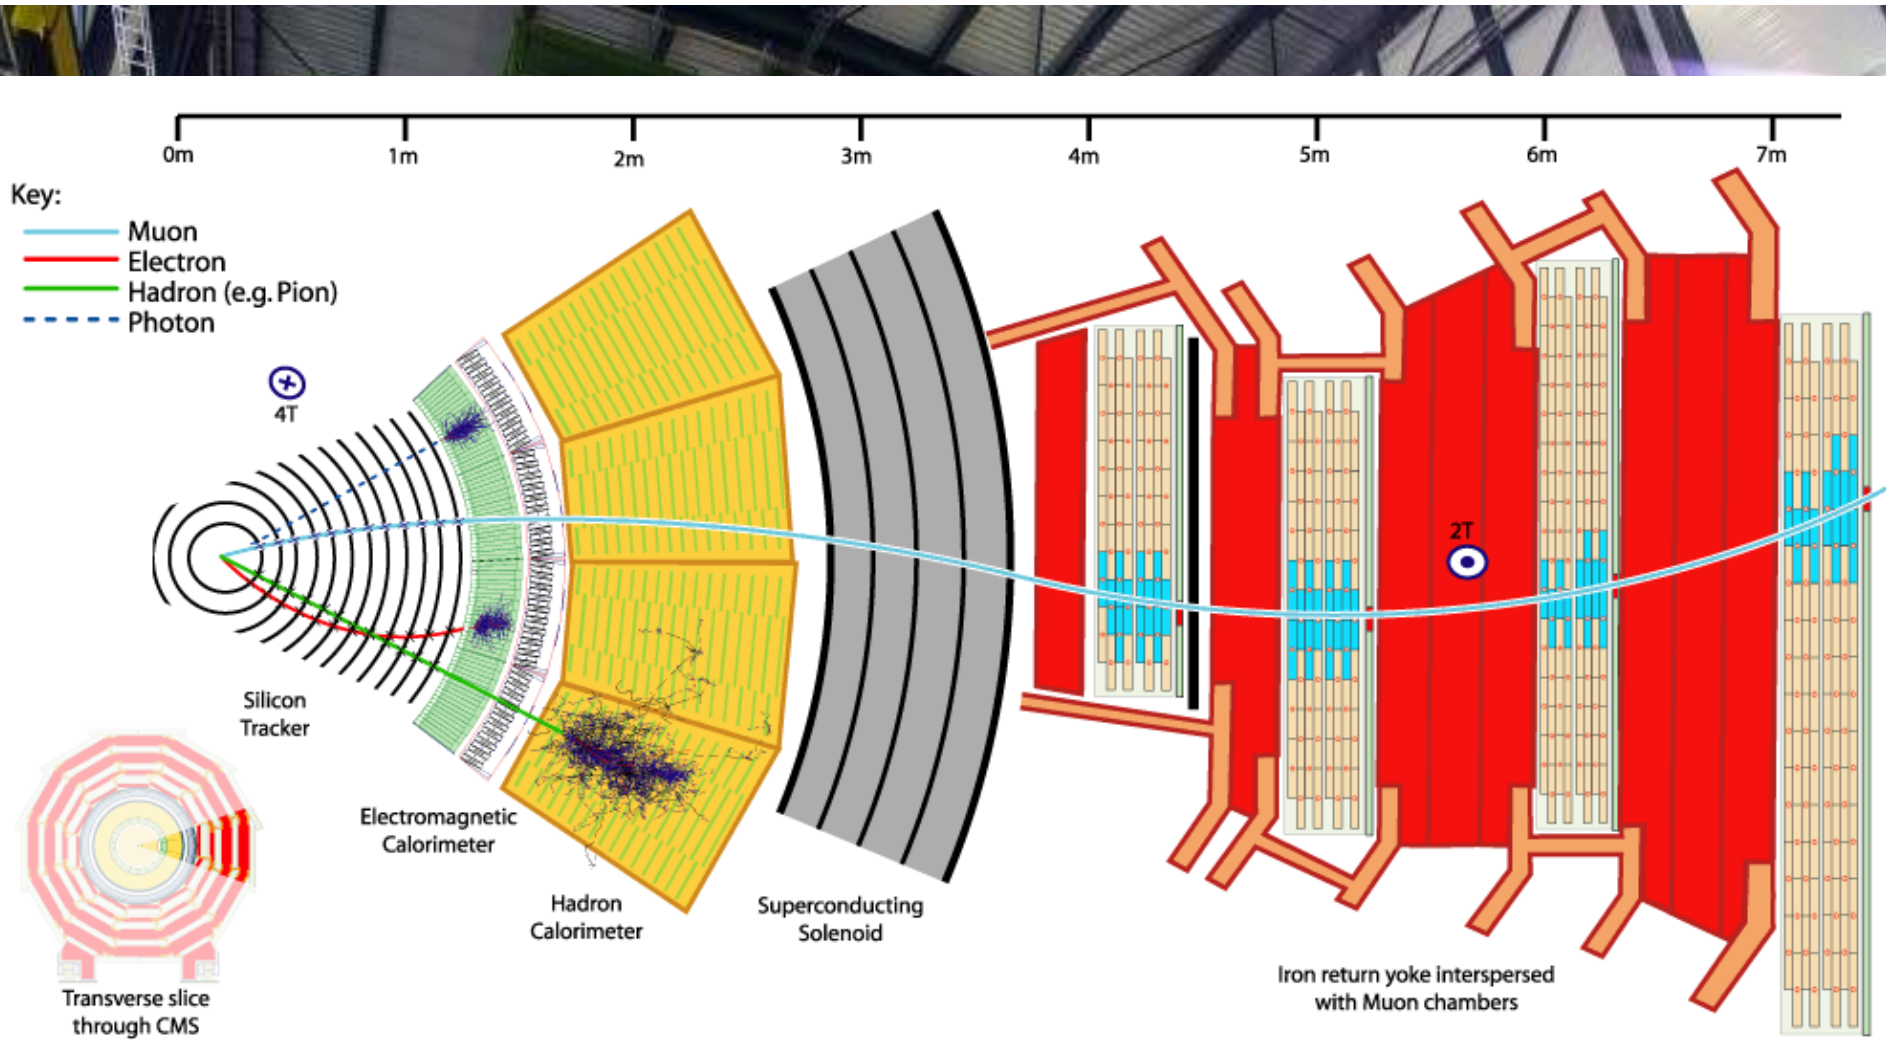

*(Example: the ATLAS Transition Radiation Tracker)*

# The CMS Detector

# CMS

# Different Magnet Concept of LHC Detectors

- + high homogenous field inside coil, excellent momentum resolution
  - expensive
  - Thick coils, lot of material influences particles going from trackers to calorimeters
- CMS, ALICE, LEP Detektoren

- + covers large volume
- + air coil, not a lot of material
- Requires additional
- Field less uniform
- Complex structure

# *It's fun operating detectors!!!*

*(pictures from the first LHC beam day, Sept 11 2008)*

Experiments at the LHC

EIROforum

*...and more fun: analysing Physics Pictures, e.g. search for the Higgs*

# ***...and more fun: analysing Physics Pictures, e.g. search for the Higgs***

**Keep in mind:**

**The nice event pictures are simulations!!!  
(simulations are important tools for high energy physics experiments, simulations give predictions from what we already know and extrapolate the knowledge to the collisions at higher energies! Deviations from the measurements w.r.t. the simulations are exciting!!!)**

**We are looking forward to have real collisions, thus real photos soon!!!**

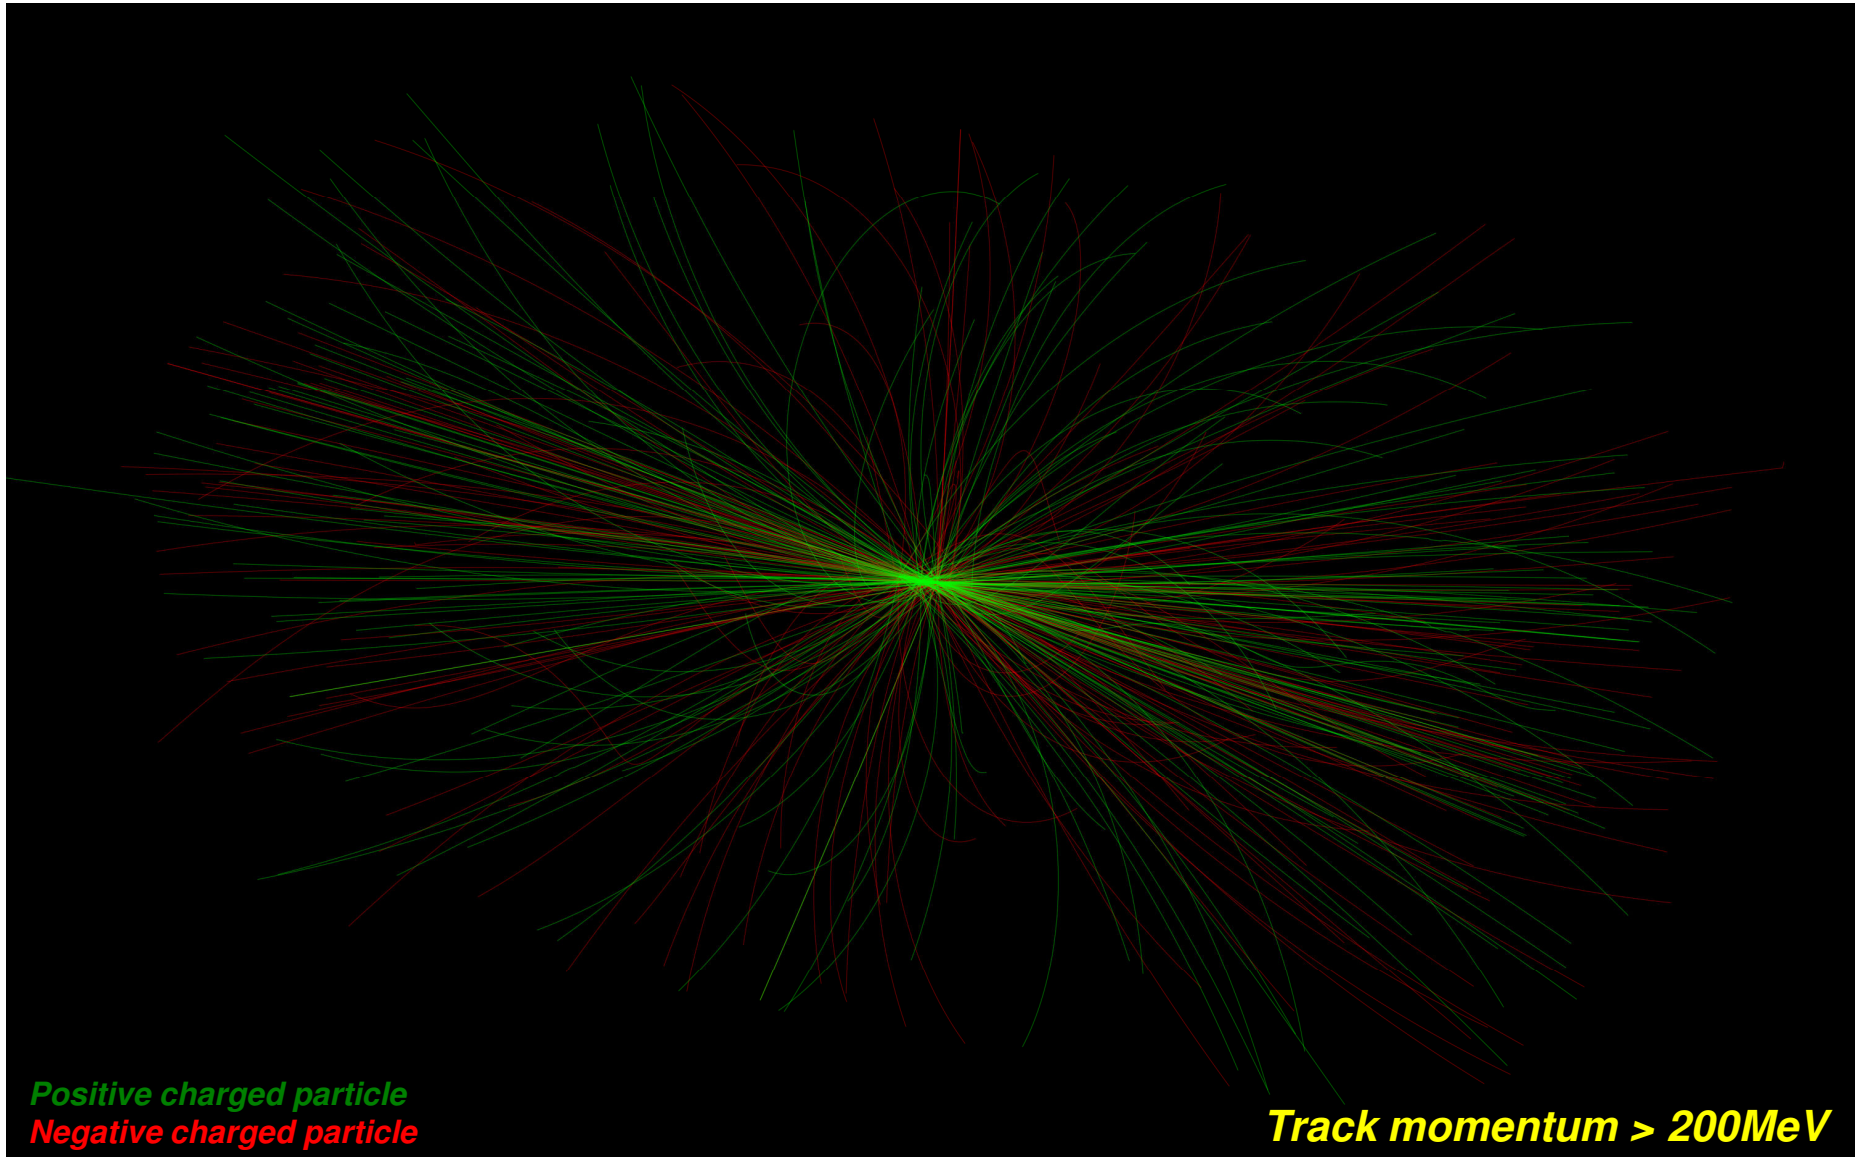

# Search for the Higgs Boson

- One way we expect the Higgs to be produced and to decay (Signal):

- ... how to find “photos” of this process?

# *Simulated Event, tracks only*

# *Simulated Event, tracks only*

*Positive charged particle*  
*Negative charged particle*

*Track momentum > 1 GeV*

# *Simulated Event, tracks only*

*Positive charged particle*  
*Negative charged particle*

*Track momentum > 3 GeV*

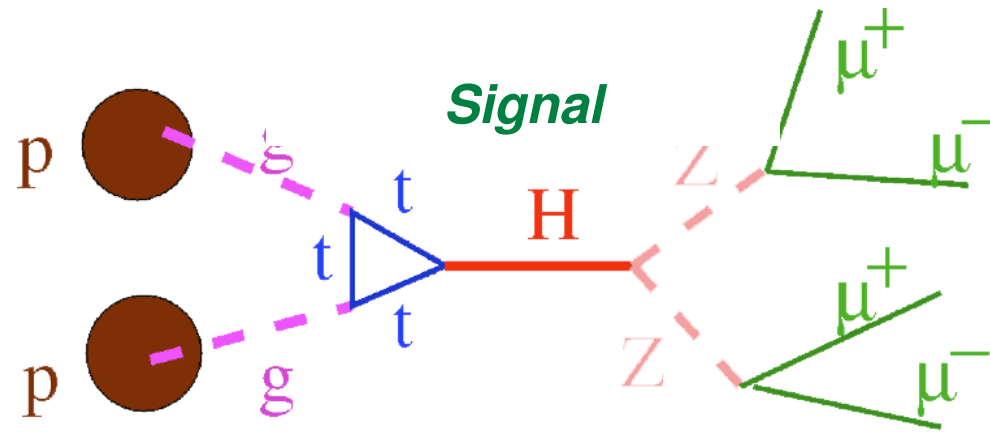

# *Simulated Event, tracks only*

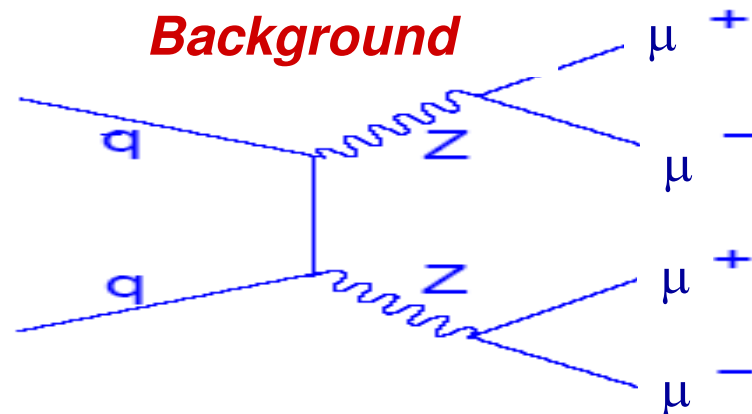

# Search for the Higgs Boson

- One way we expect the Higgs to be produced and to decay (Signal):

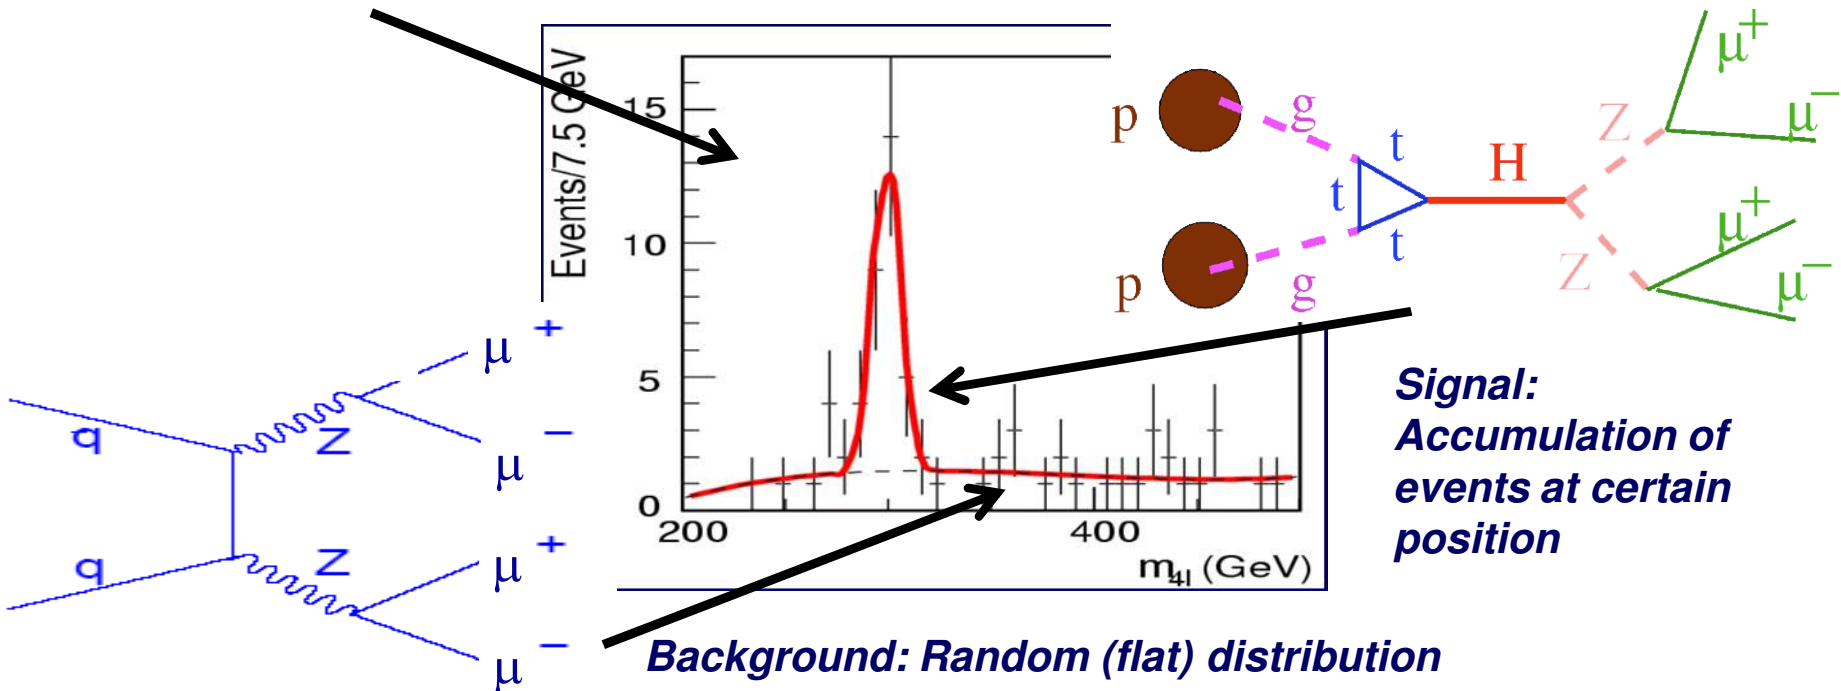

- ...but 4 muons could be also produced by the following process (background)

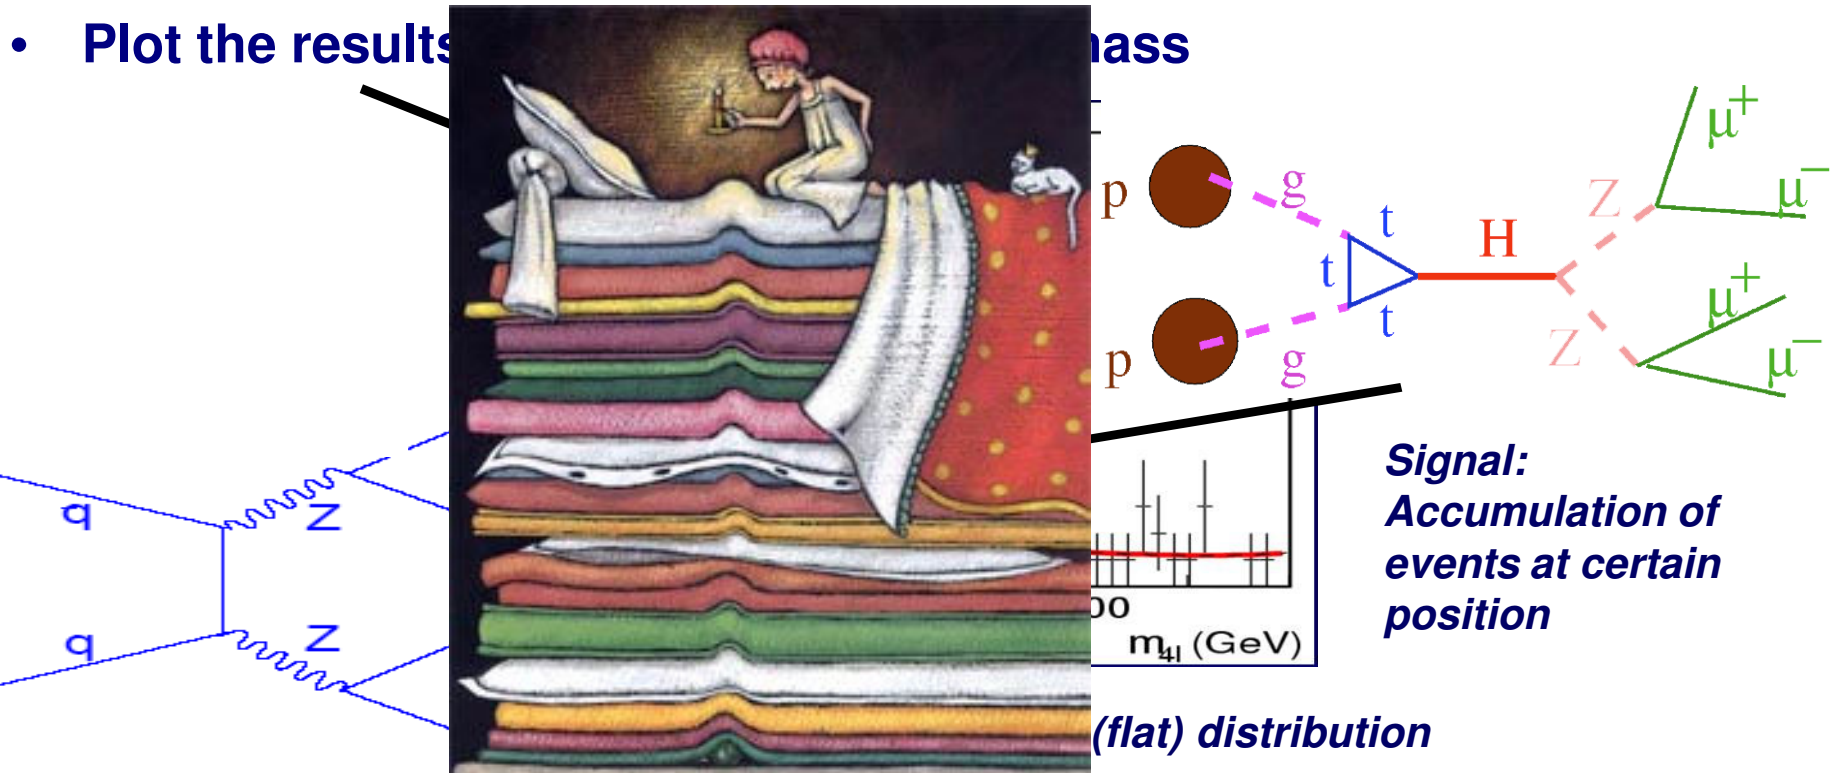

# Search for the Higgs Boson

- Trick: “combine” one positive charged track and one negative charge track and calculate the momentum and energy of the “mother” particle, the Z
  - Using momentum conservation, energy conservation
- “combine” the 2 Z particles and calculate mass of the “mother” particle, possibly the Higgs
- Plot the results for the possible Higgs mass

# Search for the Higgs Boson

- Trick: “combine” one positive charged track and one negative charge track and calculate the momentum and energy of the “mother” particle, the Z
  - Using momentum conservation, energy conservation
- “combine” the 2 Z particles and calculate mass of the “mother” particle, possibly the Higgs
- Plot the results

# *Search for Dark Matter – Motivation*

*(personal motivation)*

# Search for Dark Matter – Motivation

*(personal motivation)*

Have another view, same region of the sky, infra red...

⇒ two galaxies just collided!  
(galaxy cluster 1E 0657-56)

# A closer look, gravitational lensing

## GRAVITATIONAL LENSING:

### 1 A Distant Source

Light leaves a young, star-forming blue galaxy near the edge of the visible universe.

### 2 A Lens Of 'Dark Matter'

Some of the light passes through a large cluster of galaxies and surrounding dark matter, directly in the line of sight between Earth and the distant galaxy. The dark matter's gravity acts like a lens, bending the incoming light.

### 3 Focal Point: Earth

Most of this light is scattered, but some is focused and directed toward Earth. Observers see multiple, distorted images of the background galaxy.

# *Search for Dark Matter – Motivation*

*(personal motivation)*

# ***Analysing Photos: Search for Dark Matter - Motivation***

**Superposition of all 3 observations:  
2 different regions (red, blue) are visible...  
How to interpret these???**

# *A Simulation: red – “normal matter”, blue – dark matter (1)*

# *A Simulation: red – “normal matter”, blue – dark matter (2)*

# ***A Simulation: red – “normal matter”, blue – dark matter (3)***

# *A Simulation: red – “normal matter”, blue – dark matter (4)*

# A Simulation: red – “normal matter”, blue – dark matter (4)

4

Interpretation: while galaxies collide, the two different regions (blue and red) “feel” different de-celeration

- “normal” matter  $\Rightarrow$  all 4 forces contribute and slow down matter during the collision
- “dark” matter  $\Rightarrow$  only gravitation contributes, less force, thus less slow-down

## •DARK MATTER:

- particles which do only interact very weakly
- particles which are electrically neutral
- Thus: practically in visible!!!!

•Although other calculations indicate that 80% of the mass of the universe might be DARK MATTER!!!!

# Search for the “Invisible”: Missing Energy Signal

- Again simulation: an event in which a “dark matter particle” is produced...
- What is special in this picture, a cross section of the detector perpendicular (transverse) to the beam axis?
  - ⇒ Event is not “balanced”: energy distribution is not symmetric!
  - ⇒ But events SHOULD be balanced as incoming beam has no momentum component in this plane!
  - ⇒ Indication for DARK MATTER!!!!

# Search for the “Invisible”: Missing Energy Signal

- MET = missing transverse momentum...
- Origin could be two dark matter particles, e.g. in supersymmetric models the neutralinos ( $\tilde{\chi}_1^0$ )
- (... SUSY???)  
→ *Would need an extra talk...*

# Looking forward!!!!

Designed by my  
1998 Summer Student

- The LHC accelerator and detectors provide a great opportunity to search for answers to fundamental questions!
- It was exciting to build and commission the experiments...
- ...and now it is time to look at the data!!!!

**It will be phantastic!!!!**
