## MADMAX: A new way to search for QCD Axion Dark Matter with a Dielectric Haloscope

*Thursday, July 26, 2018 4:55 PM (25 minutes)*

Light Dark Matter candidates have increasingly come under the focus of scientific interest. In particular the QCD axion is also able to solve other fundamental problems such as CP-conservation in strong interactions. Galactic axions and axion-like particles can be converted to photons at boundaries between materials of different dielectric constants under a strong magnetic field. Combining many such surfaces, one can enhance this conversion significantly using constructive interference and resonances. The proposed MADMAX setup containing 80 high dielectric disks in a 10 T magnetic field could probe the well-motivated mass range of  $40 - 400 \mu\text{eV}$ , a range which is at present inaccessible by existing cavity searches. The experimental idea and the proposed design of MADMAX will be discussed. Among recent R&D results from finite element simulations and proof-of-principle prototype measurements, the prospects of reaching sensitivity to the QCD axion will be presented.
