## DarkSide latest results and the future liquid argon dark matter program

*Tuesday, July 24, 2018 11:00 AM (25 minutes)*

DarkSide-50 is a dual-phase argon time projection chamber (TPC) with a 50 kg active volume that has been operating at the Gran Sasso National Laboratory (LNGS) since mid-2015. I will present the latest dark matter search results from this detector and their implications for a next-generation experiment, DarkSide-20k, a more than 20 tonne fiducial mass TPC equipped with SiPM-based photosensors. DarkSide-20k is expected to achieve an instrumental background well below that from coherent scattering of solar and atmospheric neutrinos and achieve exclusion sensitivity to a WIMP-nucleon cross section of  $10^{-47}$  cm<sup>2</sup> for a 1 TeV WIMP in a 5 year run.
