

# LHCb RESULTS ON FLAVOUR ANOMALIES

- Introduction
- Lepton Universality in penguins
- Angular distributions
- More Lepton Universality in trees

On behalf of the LHCb collaboration

Since many theorists speak after me, I leave interpretation (mostly) aside.

# LHCb DETECTOR

Forward detector: many  $b$  hadrons produced forward at LHC, ( $144 \pm 1 \pm 21$ )  $\mu\text{b}$  in acceptance at 13TeV [PRL 118 (2017) 052002]

- Warm dipole magnet. Polarity can be reversed
- ✓ Good momentum and position resolution
  - Vertex detector gets 8mm to the beam

# LHCb DETECTOR

Forward detector: many  $b$  hadrons produced forward at LHC, ( $144 \pm 1 \pm 21$ )  $\mu\text{b}$  in acceptance at 13TeV [PRL 118 (2017) 052002]

- Warm dipole magnet. Polarity can be reversed
- ✓ Good momentum and position resolution, high efficiency
- ✓ Excellent Particle ID

# INTEGRATED LUMINOSITY

## LHCb Integrated Recorded Luminosity in pp, 2010-2018

# INTEGRATED LUMINOSITY

LHCb Cumulative Integrated Recorded Luminosity in pp, 2010-2018

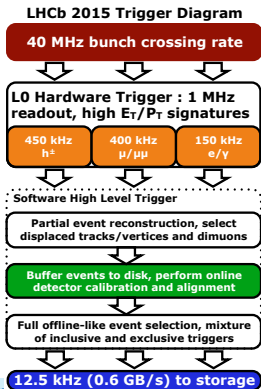

# LHCb TRIGGER IN RUN 2

Versatile two stage trigger

- Hardware-based L0 trigger: moderate  $p_T$  cuts → 1 MHz  
→ Whole data sent to trigger farm
- Calibrate in real-time → 12 kHz output (some reduced size)

## DIMUON MASS DISTRIBUTION

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

Run 2

Mass plot shows candidates with  $\text{BDT} > 0.5$ .

The significances are  $7.8\sigma$  for  $B_s^0 \rightarrow \mu^+ \mu^-$  and  $1.6\sigma$  for  $B^0 \rightarrow \mu^+ \mu^-$ .

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

Run 2

No anomaly!

The results  $\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (3.0 \pm 0.6 \pm_{-0.2}^{+0.3}) \times 10^{-9}$  and  $\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (1.5 \pm_{-1.0}^{+1.2} \pm_{-0.1}^{+0.2}) \times 10^{-10}$  are consistent with the SM.

[Bobeth et al., PRL 112 101801 (2014)]

anomalies

# FLAVOUR ANOMALIES

$b \rightarrow sl^+l^-$   
FCNC

Flavour  
anomalies

$$b \rightarrow s l^+ l^-$$

- Start with  $b \rightarrow s \gamma$

$$b \rightarrow s l^+ l^-$$

- Start with  $b \rightarrow s \gamma$ , pay a factor  $\alpha_{\text{EM}}$   
 → Decay the  $\gamma$  into 2 leptons

$$b \rightarrow sl^+l^-$$

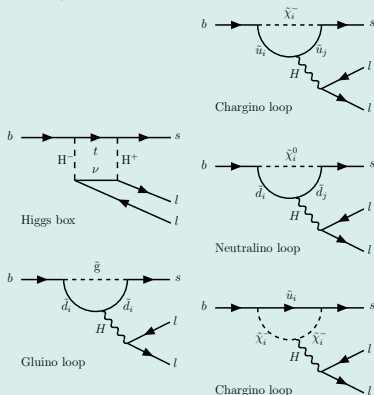

- Start with  $b \rightarrow s\gamma$ , pay a factor  $\alpha_{\text{EM}}$ 
  - Decay the  $\gamma$  into 2 leptons
    - Add an interfering box diagram
  - $b \rightarrow sl^+l^-$ , very rare in the SM
 
$$\mathcal{B}(B \rightarrow K^*l^+l^-) = (1.8 \pm 0.2) \cdot 10^{-6}$$

[Huber et al., Nucl.Phys.B802:40-62,2008]

$$b \rightarrow sl^+l^-$$

- Start with  $b \rightarrow s\gamma$ , pay a factor  $\alpha_{EM}$ 
    - Decay the  $\gamma$  into 2 leptons
      - Add an interfering box diagram
      - $b \rightarrow sl^+l^-$ , very rare in the SM
  - Sensitive to Supersymmetry, Any 2HDM, Fourth generation, Extra dimensions, Leptoquarks, Axions ...
- ✓ Ideal place to look for new physics

$$b \rightarrow s l^+ l^-$$

- Start with  $b \rightarrow s \gamma$ , pay a factor  $\alpha_{\text{EM}}$

→ Decay the  $\gamma$  into 2 leptons

- Add an interfering box diagram

→  $b \rightarrow s l^+ l^-$ , very rare in the SM

- ✗ But beware of long-distance effects:

- Tree  $b \rightarrow c \bar{c} s$ ,  $(c \bar{c}) \rightarrow l l$

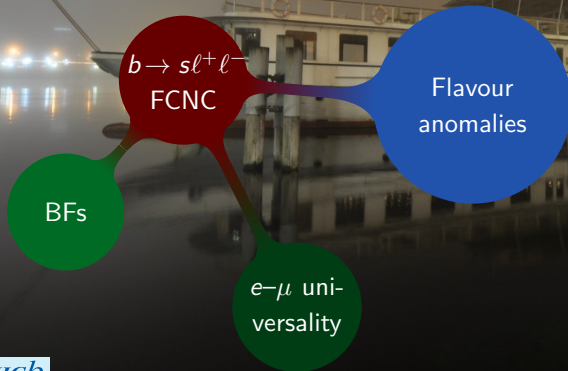

✓ Can be removed by mass cuts

✗ ✓ Interferes elsewhere

(c) Jaeger

# FLAVOUR ANOMALIES

# MODEL-INDEPENDENT $b \rightarrow s\ell^+\ell^-$

$$R_X = \frac{\int_{q_{\min}^2}^{q_{\max}^2} ds \frac{d\Gamma(B \rightarrow X\mu^+\mu^-)}{ds}}{4m_\mu^2 \int_{q_{\min}^2}^{q_{\max}^2} ds \frac{d\Gamma(B \rightarrow Xe^+e^-)}{ds}} \stackrel{\text{SM}}{=} \begin{cases} 1.000 \pm 0.001 & X = K \\ 0.991 \pm 0.002 & X = K^* \end{cases}$$

[Hiller & Krüger, PRD69 (2004) 074020]

**Lepton universality is an accidental symmetry  
of the gauge Lagrangian**

**May be violated at some level.**

LEPTON UNIVERSALITY WITH  $B^+ \rightarrow K^+ \ell^+ \ell^-$ 

- Measure ratio  $R_K$  of  $B^+ \rightarrow K^+ \mu^+ \mu^-$  to  $B^+ \rightarrow K^+ e^+ e^-$  in  $1 < q^2 < 6 \text{ GeV}^2$ 
  - ✓ Signal clearly visible in  $K^+ \mu^+ \mu^-$
- See
  - $254^{+29}_{-27} B^+ \rightarrow K^+ e^+ e^-$  and
  - $1226 \pm 41 B^+ \rightarrow K^+ \mu^+ \mu^-$
- Build a double ratio  $R_K = \left( \frac{\mathcal{N}_{K^+ \mu^+ \mu^-}}{\mathcal{N}_{K^+ e^+ e^-}} \right) \left( \frac{\mathcal{N}_{J/\psi(e^+ e^-) K^+}}{\mathcal{N}_{J/\psi(\mu^+ \mu^-) K^+}} \right) = 0.745^{+0.090}_{-0.074} \pm 0.036$ 
  - ✓  $2.6\sigma$  from unity

LEPTON UNIVERSALITY IN  $B^0 \rightarrow K^{*0} \ell^+ \ell^-$ 

Measure ratio  $R_{K^*}$  of  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$  to  $B^0 \rightarrow K^{*0} e^+ e^-$  in  $0.045 < q^2 < 1.1$  and  $1.1 < q^2 < 6 \text{ GeV}^2$

✓ Signal clearly visible in  $K^{*0} \mu^+ \mu^-$

- Yields entering the double ratio:

	$B^0 \rightarrow K^{*0} \ell^+ \ell^-$		$B^0 \rightarrow J/\psi K^{*0}$
	low- $q^2$	central- $q^2$	
$\mu^+ \mu^-$	$285 \pm 18$	$353 \pm 21$	$274416 \pm_{602}^{654}$
$e^+ e^-$	$89 \pm_{10}^{11}$	$111 \pm_{13}^{14}$	$43468 \pm 222$

LEPTON UNIVERSALITY IN  $B^0 \rightarrow K^{*0} \ell^+ \ell^-$ 

Measure ratio  $R_{K^*}$  of  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$  to  $B^0 \rightarrow K^{*0} e^+ e^-$  in  $0.045 < q^2 < 1.1$  and  $1.1 < q^2 < 6 \text{ GeV}^2$

✓ Signal clearly visible in  $K^{*0} \mu^+ \mu^-$

- Yields entering the double ratio:

	$B^0 \rightarrow K^{*0} \ell^+ \ell^-$		$B^0 \rightarrow J/\psi K^{*0}$
	low- $q^2$	central- $q^2$	
$\mu^+ \mu^-$	$285 \pm 18$	$353 \pm 21$	$274416 \pm_{-654}^{602}$
$e^+ e^-$	$89 \pm_{-10}^{11}$	$111 \pm_{-13}^{14}$	$43468 \pm 222$

Build a double ratio  $R_K =$

$$\left( \frac{\mathcal{N}_{K^{*0} \mu^+ \mu^-}}{\mathcal{N}_{K^{*0} e^+ e^-}} \right) \left( \frac{\mathcal{N}_{J/\psi(e^+ e^-) K^{*0}}}{\mathcal{N}_{J/\psi(\mu^+ \mu^-) K^{*0}}} \right)$$

$$= \begin{cases} 0.66 \pm_{-0.07}^{+0.11} \pm 0.03 & 0.045 < q^2 < 1.1 \\ 0.69 \pm_{-0.07}^{+0.11} \pm 0.05 & 1.1 < q^2 < 6.0 \end{cases}$$

This about 2 to 2.5 $\sigma$  from the SM, depending on predictions. [BIP, EPJC 76 440] [CDHMV, JHEP04(2017)016]

[EOS, PRD 95 035029] [flav.io, EPJC 77 377] [JC, PRD93 014028]

Lattice

LHCb  
~~THCP~~

Sum  
Rules

# $B \rightarrow h\ell^+\ell^-$ FORM FACTORS FROM MILC

$B^+ \rightarrow \pi^+\ell^+\ell^-$  [JHEP 10 (2015) 034] and  $B \rightarrow K\ell^+\ell^-$  [JHEP 06 (2014) 133] are all below the lattice computations.

# PHASES IN $B^+ \rightarrow K^+ \ell^+ \ell^-$

Use a large sample of ( $\sim 1\text{M}$ )  $B^+ \rightarrow K^+ \mu^+ \mu^-$  decays including  $B^+ \rightarrow J/\psi K^+$  and  $B^+ \rightarrow \psi(2S) K^+$  to determine the interference of SD  $B^+ \rightarrow K^+ \mu^+ \mu^-$  and dimuons from resonances.

- The  $q^2$  distribution is used. The efficiency is determined from simulation.
- Included resonances:  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$ ,  $J/\psi$ ,  $\psi(2S)$ ,  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$  [PRL 111 (2013) 112003],  $\psi(4415)$

# PHASES IN $B^+ \rightarrow K^+ \ell^+ \ell^-$

Four fits match the data, all with a  $J/\psi$  – short-distance phase difference consistent with  $\pm \frac{\pi}{2}$

- the interference with the short-distance component far from the pole masses is small

$$\begin{aligned}\varphi(J/\psi) &= -1.66 \pm 0.05 \\ \varphi(\psi(2S)) &= -1.93 \pm 0.20\end{aligned}$$

$$\begin{aligned}\varphi(J/\psi) &= +1.47 \pm 0.05 \\ \varphi(\psi(2S)) &= -2.21 \pm 0.11\end{aligned}$$

$$\begin{aligned}\varphi(J/\psi) &= -1.50 \pm 0.05 \\ \varphi(\psi(2S)) &= +2.08 \pm 0.11\end{aligned}$$

$$\begin{aligned}\varphi(J/\psi) &= +1.63 \pm 0.05 \\ \varphi(\psi(2S)) &= +1.80 \pm 0.10\end{aligned}$$

The BF is measured over the whole  $q^2$  range:

$$\mathcal{B}(B^+ \rightarrow K^+ \mu^+ \mu^-) = (4.37 \pm 0.15 \pm 0.23) \times 10^{-7}$$

PHASES IN  $B^+ \rightarrow K^+ \ell^+ \ell^-$ 

The Wilson coefficients  $C_9$  and  $C_{10}$  are also fitted for, leading to a deviation from the SM expectation at  $3\sigma$

# FLAVOUR ANOMALIES

# $B \rightarrow K^* \ell^+ \ell^-$ ANGULAR DISTRIBUTIONS

A lot of information in the full  $\theta_\ell$ ,  $\theta_K$  and  $\phi$  distributions

$$\frac{1}{\Gamma} \frac{d^4\Gamma}{d \cos \theta_\ell d \cos \theta_K d\hat{\phi} dq^2} = \frac{9}{32\pi} \left[ \frac{3}{4} (1 - F_L) \sin^2 \theta_K + F_L \cos^2 \theta_K \right. \\ \left. + \frac{1}{4} (1 - F_L) \sin^2 \theta_K \cos 2\theta_\ell - F_L \cos^2 \theta_K \cos 2\theta_\ell \right. \\ \left. + S_3 \sin^2 \theta_K \sin^2 \theta_\ell \cos 2\phi \right. \\ \left. + S_4 \sin 2\theta_K \sin 2\theta_\ell \cos \phi \right. \\ \left. + S_5 \sin 2\theta_K \sin \theta_\ell \cos \phi \right. \\ \left. + S_6 \sin^2 \theta_K \cos \theta_\ell + S_7 \sin 2\theta_K \sin \theta_\ell \sin \phi \right. \\ \left. + S_8 \sin 2\theta_K \sin 2\theta_\ell \sin \phi \right. \\ \left. + S_9 \sin^2 \theta_K \sin^2 \theta_\ell \sin 2\phi \right]$$

$$\rightarrow P'_5 = \frac{S_5}{\sqrt{F_L(1-F_L)}}$$

[Descotes-Genon et al., JHEP, 1305 137]

# ANGULAR ANALYSIS OF $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

Update of [\[JHEP 08 \(2013\) 131\]](#) and [\[PRL 111 \(2013\) 191801\]](#) to  $3 \text{ fb}^{-1}$ . S-wave is taken into account, we have finer bins, and no  $\varphi$  folding is needed.

- **Max Likelihood fit:** 4D fit to  $m(K^+ \pi^-)$  and three angles in bins of  $q^2$ .
- Observables consistent with SM, except  $S_5$
- $P'_5 = S_5 / \sqrt{F_L(1 - F_L)}$  has a local discrepancy in two bins
- $A_{\text{FB}}$  seems to show a trend, but is consistent with SM

# ANGULAR ANALYSIS OF $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

## What is $P'_5$ ?

It is an asymmetry built with  $\cos \theta_K$  and  $|\phi|$ , shown in the sketch. (integrating over one of the two gets zero).

The discrepancy with the SM prediction is visible in both angular distributions.

# ALL $P'_5$ MEASUREMENTS

$$R(D^*) \stackrel{\text{SM}}{=} 0.252 \pm 0.003,$$

$$R(D) \stackrel{\text{SM}}{=} 0.297 \pm 0.017$$

$B^0 \rightarrow D^{*+} \tau \nu$  AT LHCb

- $B^0 \rightarrow D^{*+} \tau^- \bar{\nu}$  with  $\tau^- \rightarrow \mu^- \nu \bar{\nu}$  and  $B^0 \rightarrow D^{*+} \mu^- \bar{\nu}$ : same final state.
- Disentangled by kinematical variables :  $q^2$ ,  $E_{\mu}^*$ ,  $m_{\text{miss}}^2$ .
- A template fit in  $q^2$  bins determines signal yields
- Get  $36300 \pm 1600$   $B \rightarrow D^{*+} \mu^- \bar{\nu}$  decays and  $R_{D^*} = 0.336 \pm 0.027 \pm 0.030$
- $\rightarrow 2.1\sigma$  above the SM

$$B^0 \rightarrow D^{*-} \tau^+ \nu_\tau \text{ WITH } \tau^+ \rightarrow \pi^+ \pi^- \pi^+ (\pi^0) \bar{\nu}_\tau$$

Signal and backgrounds are determined by a three-dimensional binned fit to  $t_\tau$ ,  $q^2$  and BDT output.

- signal yield:  $1273 \pm 85$ .
- Normalised to

$$B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+$$

[PRD 87 (2013) 092001], yielding

$$\mathcal{B}(B \rightarrow D^{*} \tau^+ \nu_\tau) =$$

$$(1.40 \pm 0.09 \pm 0.12 \pm 0.10)\%$$

$\mathcal{R}(D^{*}) = 0.286 \pm 0.019 \pm 0.025 \pm 0.021$ ,  $1\sigma$  above the SM ( $0.252 \pm 0.003$  [Fajfer et al.]) and consistent with the world average.

# FLAVOUR ANOMALIES

It could be new vector bosons, or leptoquarks

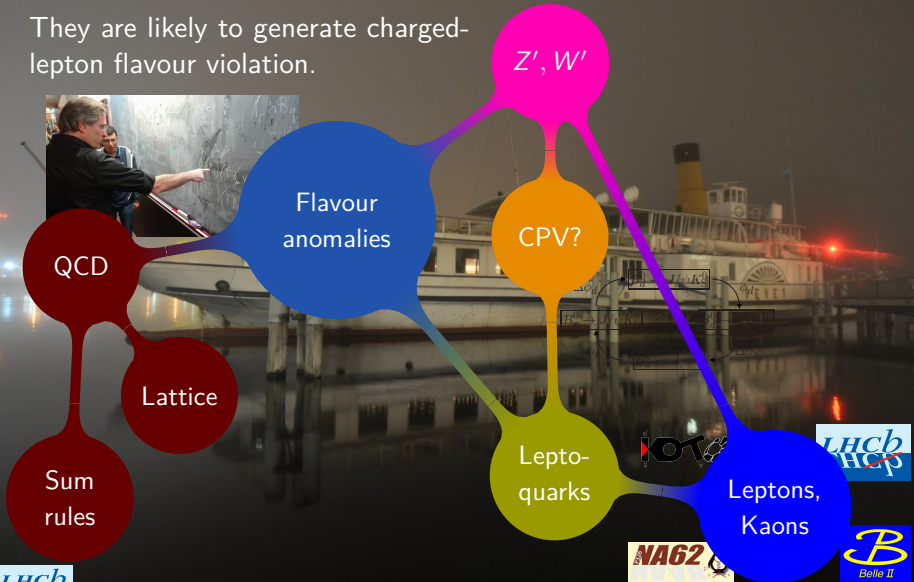

# FLAVOUR ANOMALIES

Why is there no  $CP$  violation beyond the CKM matrix?

# FLAVOUR ANOMALIES

They are likely to generate charged-lepton flavour violation.

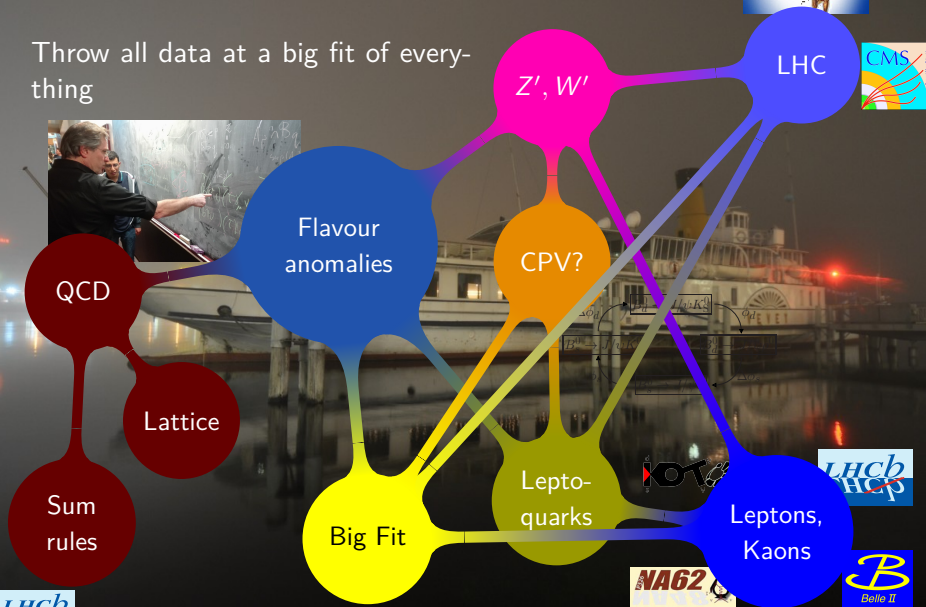

# FLAVOUR ANOMALIES

Can we see the bosons or leptoquarks at ATLAS and CMS?

# FLAVOUR ANOMALIES

Throw all data at a big fit of everything

# INTEGRATED LUMINOSITY

# Conclusion

BSM searches and flavour physics  
yield null results, except (maybe)

- $b \rightarrow s \ell^+ \ell^-$  loop transitions, hinting toward a new vector current
  - ... that would not be  $e-\mu$  symmetric
  - $b \rightarrow c \tau \nu$  tree transitions yield too many  $\tau$  leptons.
- Leptoquarks, vector bosons, supersymmetry, or SM?

# Backup

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

A  $B \rightarrow \mu^+ \mu^-$  search using 2011–2016 data is done with a mass fit in bins of BDT output.

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The BDT is optimised to fight combinatorial and specific backgrounds.

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The BDT is calibrated using  $B \rightarrow h^+ h^-$  decays, which have the same topology.

Here for Run 1

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The BDT is calibrated using  $B \rightarrow h^+ h^-$  decays, which have the same topology.

Here for Run 2

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The mass resolution is calibrated using the decays  $J/\psi \rightarrow \mu^+ \mu^-$ ,  $\psi(2S) \rightarrow \mu^+ \mu^-$  and  $\Upsilon([1, 2, 3]S) \rightarrow \mu^+ \mu^-$  and interpolated to  $23 \text{ MeV}/c^2$  at the  $B_s^0$  mass.

This is checked with  $B^0 \rightarrow K^+ \pi^-$  and  $B_s^0 \rightarrow K^+ K^-$ .

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The mass resolution is calibrated using the decays  $J/\psi \rightarrow \mu^+ \mu^-$ ,  $\psi(2S) \rightarrow \mu^+ \mu^-$  and  $\Upsilon([1, 2, 3]S) \rightarrow \mu^+ \mu^-$  and interpolated to  $23 \text{ MeV}/c^2$  at the  $B_s^0$  mass.

This is checked with  $B^0 \rightarrow K^+ \pi^-$  and  $B_s^0 \rightarrow K^+ K^-$ .

OBSERVATION OF THE DECAY  $B_S^0 \rightarrow \mu^+ \mu^-$ 

$B^0 \rightarrow K^+\pi^-$  and  $B^+ \rightarrow J/\psi K^+$  are used to normalise the  $B \rightarrow \mu^+\mu^-$  branching fractions. The factors are  $a_{B_S^0 \rightarrow \mu^+\mu^-}^{\text{norm}} = (5.7 \pm 0.4) \times 10^{-11}$  and  $a_{B^0 \rightarrow \mu^+\mu^-}^{\text{norm}} = (1.60 \pm 0.04) \times 10^{-11}$ .

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

Mass fits are performed in bins of BDT output, separately for Run 1 and Run 2 data.

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

Mass fits are performed in bins of BDT output, separately for Run 1 and Run 2 data.

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

Mass plot shows candidates with  $\text{BDT} > 0.5$ .

The significances are  $7.8\sigma$  for  $B_s^0 \rightarrow \mu^+ \mu^-$  and  $1.6\sigma$  for  $B^0 \rightarrow \mu^+ \mu^-$ .

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The results  $\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (3.0 \pm 0.6 \pm_{-0.2}^{+0.3}) \times 10^{-9}$  and  $\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (1.5 \pm_{-1.0}^{+1.2} \pm_{-0.1}^{+0.2}) \times 10^{-10}$  are consistent with the SM.

[Bobeth et al., PRL 112 101801 (2014)]

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

The results  $\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (3.0 \pm 0.6 \pm_{-0.2}^{+0.3}) \times 10^{-9}$  and  $\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (1.5 \pm_{-1.0}^{+1.2} \pm_{-0.1}^{+0.2}) \times 10^{-10}$  are consistent with the SM.

[Bobeth et al., PRL 112 101801 (2014)]

OBSERVATION OF THE DECAY  $B_s^0 \rightarrow \mu^+ \mu^-$ 

As no excess of  $B^0 \rightarrow \mu^+ \mu^-$  is found, a limit at  $3.4 \times 10^{-10}$  at 95% confidence level is set.

# $B_s^0 \rightarrow \mu^+ \mu^-$ RACE TOWARD THE SM

# $B \rightarrow \mu^+ \mu^-$ EFFECTIVE LIFETIME

The effective lifetime allows the extraction of

$$\mathcal{A}_{\Delta\Gamma} y_s = \frac{(1 - y_s^2)\tau_{\mu^+\mu^-} - (1 + y_s^2)\tau_{B_s^0}}{2\tau_{B_s^0} - (1 - y_s^2)\tau_{\mu^+\mu^-}}$$

$$\text{with } y_s = \frac{1}{2}\tau_{B_s^0}\Delta\Gamma_s = 0.075 \pm 0.010 \quad \text{[HFAQ]}$$

This gives sensitivity to the (pseudo-) scalar operators  $\mathcal{O}_{P,S}$  with Wilson coefficients  $P$  and  $S$  ( $= 1, 0$  in SM):

$$\begin{aligned} R &\equiv \frac{\text{BR}(B_s^0 \rightarrow \mu^+\mu^-)_{\text{exp}}}{\text{BR}(B_s^0 \rightarrow \mu^+\mu^-)_{\text{SM}}} = \left[ \frac{1 + \mathcal{A}_{\Delta\Gamma} y_s}{1 - y_s^2} \right] (|P|^2 + |S|^2) \\ &= \left[ \frac{1 + y_s \cos 2\varphi_P}{1 - y_s^2} \right] |P|^2 + \left[ \frac{1 - y_s \cos 2\varphi_S}{1 - y_s^2} \right] |S|^2, \end{aligned}$$

LHCb expects  $\mathcal{O}(500)$  events with  $50 \text{ fb}^{-1}$ , as many as for  $\tau_{\text{eff}}(B_s^0 \rightarrow KK)$  [Phys.Lett. B702 (2012) 349-356, arXiv:1111.0521]

# $B_s^0 \rightarrow \mu^+ \mu^-$ EFFECTIVE LIFETIME

For the first time the effective lifetime of  $B_s^0 \rightarrow \mu^+ \mu^-$  is measured, as proposed by [De Bruyn, PK, et al., PRL 109, 041801 (2012)].

- Only candidates with  $\text{BDT} > 0.55$  are used.
- The time acceptance is taken from simulation.

# $B_s^0 \rightarrow \mu^+ \mu^-$ EFFECTIVE LIFETIME

For the first time the effective lifetime of  $B_s^0 \rightarrow \mu^+ \mu^-$  is measured, as proposed by [De Bruyn, PK, et al., PRL 109, 041801 (2012)].

- Only candidates with  $\text{BDT} > 0.55$  are used.
- The time acceptance is taken from simulation.
- The time acceptance is validated using  $B^0 \rightarrow K^+ \pi^-$ , yielding  $1.52 \pm 0.03$  ps, consistent with the  $B^0$  lifetime.

# $B_s^0 \rightarrow \mu^+ \mu^-$ EFFECTIVE LIFETIME

For the first time the effective lifetime of  $B_s^0 \rightarrow \mu^+ \mu^-$  is measured, as proposed by [De Bruyn, PK, et al., PRL 109, 041801 (2012)].

- Only candidates with  $\text{BDT} > 0.55$  are used.
- The time acceptance is taken from simulation.
- Using the sPlot technique:

$$\tau_{B_s^0 \rightarrow \mu^+ \mu^-}^{\text{eff}} = 2.04 \pm 0.44 \pm 0.5 \text{ ps}$$

- Consistent with  $A_{\Delta\Gamma}^{\mu^+ \mu^-} = 1$  ( $-1$ ) at  $1\sigma$  ( $1.4\sigma$ ) level

# EXPECTED SENSITIVITY FOR LIFETIME

The expected sensitivity for this analysis was 0.32 ps but we got unlucky with 0.44 ps.

Extrapolating assuming an unchanged analysis we expect 0.079 ps for  $50 \text{ fb}^{-1}$  and 0.032 ps for  $300 \text{ fb}^{-1}$ .

This would allow disentangling the  $B_{S^H}$  and  $B_{S^L}$  states by  $6\sigma$

# $B_{(s)}^0 \rightarrow \mu^+ \mu^-$ WITH RUN 2 DATA

ATLAS now also see  $B_s^0 \rightarrow \mu^+ \mu^-$ :

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (3.2_{-0.9}^{+1.0} \text{ }_{-0.3}^{+0.5}) \times 10^{-9}$$

$$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (-1.3 \pm 2.1) \times 10^{-10} < 4.3 \times 10^{-10} \text{ (95\% C.L.)}$$

# $B_{(s)}^0 \rightarrow \mu^+ \mu^-$ WITH RUN 2 DATA

Combining with the Run 1 result [EPJC 76 (2016) 513]:

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (2.80.7) \times 10^{-9}$$

$$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (-1.9 \pm 1.6) \times 10^{-10} < 2.1 \times 10^{-10} \text{ (95\% C.L.)}$$

SEARCH FOR  $B_s^0 \rightarrow e^\pm \mu^\mp$ 

# ANGULAR ANALYSIS OF $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

Update of [JHEP 08 (2013) 131] and [PRL 111 (2013) 191801] to  $3 \text{ fb}^{-1}$ . S-wave is taken into account, we have finer bins, and no  $\varphi$  folding is needed.

- Angular acceptance obtained from MC and validated on  $B^0 \rightarrow J/\psi K^*$  decays.

# ANGULAR ANALYSIS OF $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

Update of [JHEP 08 (2013) 131] and [PRL 111 (2013) 191801] to  $3 \text{ fb}^{-1}$ . S-wave is taken into account, we have finer bins, and no  $\varphi$  folding is needed.

- Angular acceptance obtained from MC and validated on  $B^0 \rightarrow J/\psi K^*$  decays.
- **Max Likelihood fit:** 4D fit to  $m(K^+ \pi^-)$  and three angles in bins of  $q^2$ .
  - Here  $1.1 < q^2 < 6 \text{ GeV}^2/c^4$  is shown.
  - $2398 \pm 57$  decays found in total.

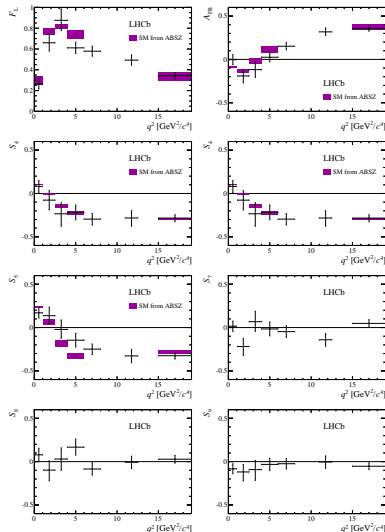

# ANGULAR ANALYSIS OF $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

Update of [JHEP 08 (2013) 131] and [PRL 111 (2013) 191801] to  $3 \text{ fb}^{-1}$ . S-wave is taken into account, we have finer bins, and no  $\varphi$  folding is needed.

- Angular acceptance obtained from MC and validated on  $B^0 \rightarrow J/\psi K^*$  decays.
- **Max Likelihood fit:** 4D fit to  $m(K^+ \pi^-)$  and three angles in bins of  $q^2$ .
- Observables consistent with SM, except  $S_5$

ANGULAR ANALYSIS OF  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ 

Update of [JHEP 08 (2013) 131] and [PRL 111 (2013) 191801] to  $3 \text{ fb}^{-1}$ . S-wave is taken into account, we have finer bins, and no  $\varphi$  folding is needed.

- **Max Likelihood fit:** 4D fit to  $m(K^+ \pi^-)$  and three angles in bins of  $q^2$ .
- Observables consistent with SM, except  $S_5$
- $P'_5 = S_5 / \sqrt{F_L(1 - F_L)}$  has a local discrepancy in two bins
- $A_{\text{FB}}$  seems to show a trend, but is consistent with SM

ANGULAR ANALYSIS OF  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ 

Update of [JHEP 08 (2013) 131] and [PRL 111 (2013) 191801] to  $3 \text{ fb}^{-1}$ . S-wave is taken into account, we have finer bins, and no  $\varphi$  folding is needed.

- **Max Likelihood fit:** 4D fit to  $m(K^+ \pi^-)$  and three angles in bins of  $q^2$ .
- Observables consistent with SM, except  $S_5$
- $P'_5 = S_5 / \sqrt{F_L(1 - F_L)}$  has a local discrepancy in two bins
- $A_{\text{FB}}$  seems to show a trend, but is consistent with SM

Comparison of  $P'_5$  between the  $1 \text{ fb}^{-1}$  analysis [PRL 111 (2013) 191801] and the  $3 \text{ fb}^{-1}$  update [JHEP 02 (2016) 104]

ANGULAR ANALYSIS OF  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ What is  $P'_5$ ?

It is an asymmetry built with  $\cos \theta_K$  and  $|\phi|$ , shown in the sketch. (integrating over one of the two gets zero).

The discrepancy with the SM prediction is visible in both angular distributions.

# ANGULAR ANALYSIS OF $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

On top of the maximum likelihood method, the paper adds two more methods

**METHOD OF MOMENTS:** Counting method, less precise but more stable: Allows for  $1 \text{ GeV}^2/c^4$  bins.

- Important test for QED corrections: They would generate tensor currents not affecting this method [Gratex,

Hopfer, Zwicky PRD93 054008].

ANGULAR ANALYSIS OF  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ 

On top of the maximum likelihood method, the paper adds two more methods

**METHOD OF MOMENTS:** Counting method, less precise but more stable: Allows for  $1 \text{ GeV}^2/c^4$  bins.

**FIT TO DECAY AMPLITUDES:**

Modelling the  $q^2$  dependence of the amplitudes one can fit for zero-crossing points more precisely

$$q_0^2(A_{\text{FB}}) \in [3.40, 4.87] \text{ GeV}^2/c^4$$

ANGULAR ANALYSIS OF  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ 

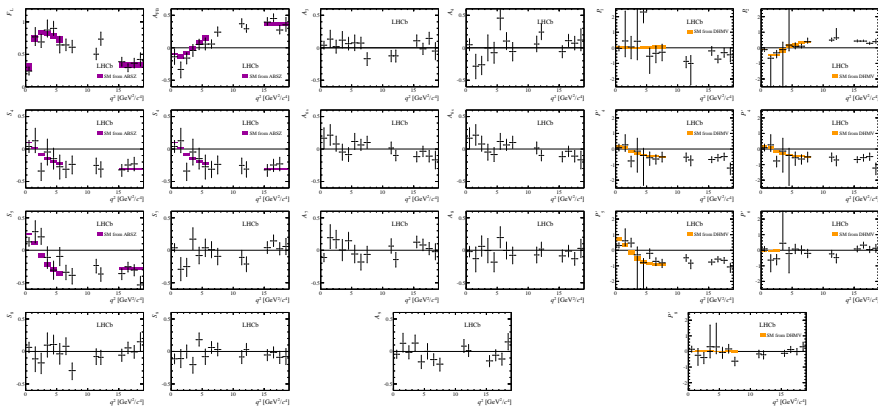

[Altmannshofer, Straub, EPJC 75 382 (2015)]

Using EOS software [Bobeth et al, JHEP 1007 098], we fit the likelihood fit results for a modified  $C_9$  (vector coupling) Wilson coefficient and get

$$\Delta C_9 = -1.04 \pm 0.25 \quad (3.4\sigma)$$

The discrepancy with the SM prediction is visible in both angular distributions.

BF AND ANGULAR ANALYSIS OF  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$ 

- Study  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$ , complementary to  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$  as baryons have non-zero spin and  $\Lambda$  decay weakly
- Reconstruct  $\Lambda$  as long and downstream → calibrate to  $\Lambda_b^0 \rightarrow J/\psi \Lambda$
- Find 345  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$ 
  - Five times more than in  $1 \text{ fb}^{-1}$  [PLB 725 (2013) 25]

BF AND ANGULAR ANALYSIS OF  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$ 

- Find 345  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$
  - Hint at very low  $q^2$ , significant only for high  $q^2$ 
    - CDF also saw nothing at low  $q^2$
- [PRL 107 201802 (2011)]

$$\mathcal{B} = (1.18 \pm 0.09 \pm 0.03 \pm 0.27) \times 10^{-7}$$

BF AND ANGULAR ANALYSIS OF  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$ 

- Find 345  $\Lambda_b^0 \rightarrow \Lambda \mu^+ \mu^-$
- Angular analysis: Measure  $A_{FB}$  of dimuon and baryonic system.
  - Some hint of an excess in  $A_{FB}^\ell$  at high  $q^2$

# EVIDENCE FOR A $B \rightarrow D^{(*)}\tau\nu$ EXCESS

■  $\bar{B} \rightarrow D\tau^-\bar{\nu}_\tau$   
 ■  $\bar{B} \rightarrow D^*\tau^-\bar{\nu}_\tau$   
 ■  $\bar{B} \rightarrow D^*(\tau^-\bar{\nu}_\tau)\bar{\nu}$   
■  $\bar{B} \rightarrow D^*\tau^-\bar{\nu}_\tau$   
 ■  $\bar{B} \rightarrow D^*\tau^-\bar{\nu}_\tau$   
 ■ Background

BaBar investigate  $B^{0,+} \rightarrow D^{(*)}\tau\nu$  with  $\tau \rightarrow \ell\nu\bar{\nu}$  and compare to  $B^{0,+} \rightarrow D^{(*)}\ell\nu$

- Full sample of 471 million  $B\bar{B}$  pairs
- The other  $B$  meson is fully reconstructed in 1680 final states
- Signal combines a  $\ell = e, \mu$  to a  $D^{(*)}$

# EVIDENCE FOR A $B \rightarrow D^{(*)}\tau\nu$ EXCESS

■  $\bar{B} \rightarrow D\tau\bar{\nu}_\tau$   
 ■  $\bar{B} \rightarrow D^*\tau\bar{\nu}_\tau$   
 ■  $\bar{B} \rightarrow D^*\ell\bar{\nu}_\ell$   
 ■  $\bar{B} \rightarrow D^{**}(\ell/\tau)\bar{\nu}$   
■  $\bar{B} \rightarrow D^*\tau\bar{\nu}_\tau$   
 ■  $\bar{B} \rightarrow D^*\ell\bar{\nu}_\ell$   
 ■ Background

BaBar investigate  $B^{0,+} \rightarrow D^{(*)}\tau\nu$  with  $\tau \rightarrow \ell\nu\bar{\nu}$  and compare to  $B^{0,+} \rightarrow D^{(*)}\ell\nu$

- Full sample of 471 million  $B\bar{B}$  pairs
  - The other  $B$  meson is fully reconstructed in 1680 final states
  - Signal combines a  $\ell = e, \mu$  to a  $D^{(*)}$
- Fit missing mass  $m_{\text{miss}}$  and momentum of lepton  $|p_\ell^*|$

Belle 2009

Belle 2010

BaBar 2012

# $R(D^*)$ WITH $\tau^+ \rightarrow (\pi^+, \rho^+) \bar{\nu}$

Using 772 million  $B\bar{B}$  pairs, Belle compare  $\bar{B}^0 \rightarrow D^{*+} \tau^- (\ell^- \nu_\tau \bar{\nu}_\ell) \bar{\nu}_\tau$  and  $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$

- 15 decay modes for  $D^0$  and  $D^+$
- 4 decay modes for  $D^{*+}$  and  $D^{*0}$
- $\tau \rightarrow \pi^+ \bar{\nu}$  and  $\tau \rightarrow \rho^+ \bar{\nu}$

They measure

$$R(D^*) = 0.270 \pm 0.035 \begin{matrix} +0.028 \\ -0.025 \end{matrix}$$

$$\tau \text{ polarisation: } P_\tau = -0.38 \pm 0.51 \begin{matrix} +0.21 \\ -0.16 \end{matrix}$$

where the  $\tau$  polarisation is the asymmetry of  $\pm \frac{1}{2}$  helicities. The SM predicts [M. Tanaka, R. Watanabe, PRD82 034028]

$$P_\tau = -0.497 \pm 0.013$$

# $B \rightarrow D^{(*)} \tau \nu$ HFLAV AVERAGE

BABAR [PRL 109 101802 (2012)] [PRD 88 072012 (2013)] Belle [PRD 92 072014 (2015)] [PRD 94 072007 (2016), arXiv:1607.07923] [PRL 118 211801 (2017)] [PRD 97 012004 (2018)] LHCb [PRL 115 (2015) 111803] [PRL 120 (2018) 171802]. Theory [Na et al., PRD 92 054410 (2015)], [Fajifer et al., PRD 85 094025 (2012)]

FIRST  $K^+ \rightarrow \pi^+ \nu \bar{\nu}$  DECAYSearch for  $K^+ \rightarrow \pi^+ \nu \bar{\nu}$ Signature is a  $\pi^+$  with missing energy  $m_{\text{miss}}^2 = (p_{K^+} - p_{\pi^+})^2$ 

See one candidate in signal box

→ Set 90% CL

$$\mathcal{B}(K^+ \rightarrow \pi^+ \nu \bar{\nu}) < 11 \times 10^{-10}$$

Consistent with SM expectation  $(8.4 \pm 1.0) \pm 10^{-11}$  [Buras, Buttazzo, Girschbach,

Knegjens, JHEP 1511 (2015) 033].

LEPTON-UNIVERSALITY IN  $D^{0,+} \rightarrow \pi^{0,+} \mu \nu$ 

Using  $2.93 \text{ fb}^{-1}$  data at 3.773 GeV BESIII study  $D^{0,+} \rightarrow \pi^{-,0} \mu^+ \nu$

$$\mathcal{B}(D^0 \rightarrow \pi^- \mu^+ \nu) = (0.267 \pm 0.007 \pm 0.007)\%$$

$$\mathcal{B}(D^+ \rightarrow \pi^0 \mu^+ \nu) = (0.342 \pm 0.011 \pm 0.010)\%$$

They combine with existing electronic BFs  
[CLEO, PRD80 (2009) 032005 ] [BESIII, PRD92 (2015) 072012] to get

$$\mathcal{R}(D^0 \rightarrow \pi^- \ell^+ \nu) = 0.905 \pm 0.027 \pm 0.023$$

$$\mathcal{R}(D^+ \rightarrow \pi^0 \ell^+ \nu) = 0.942 \pm 0.037 \pm 0.027$$

which are 1.9 and  $0.6\sigma$  below the SM expectation of 0.97.

# LHCb UPGRADE

$\mathcal{L} = 2 \cdot 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$  requires some new detectors and 40 MHz read-out clock new electronics

**VELO:** New pixel vertex detector

**TRACKERS:** New scintillating fibre tracker.

The upstream tracker is also replaced

**PID:** Hybrid photodetectors to be replaced by multi-anode PMTs

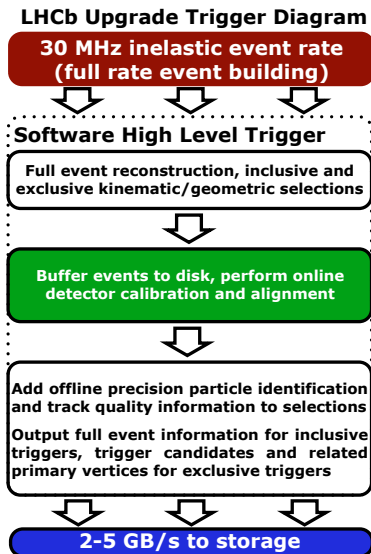

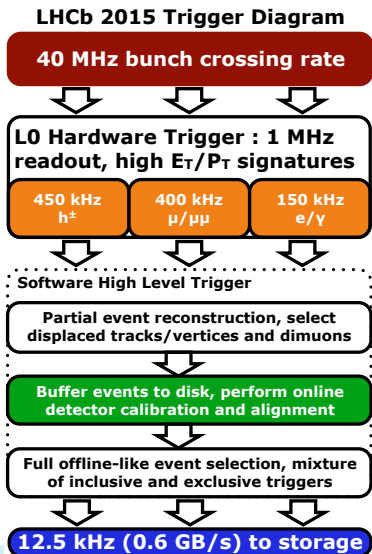

→  $50 \text{ fb}^{-1}$  by Run 4.

✓ We are preparing another upgrade for Run 5

→  $300 \text{ fb}^{-1}$

# LHCb TRIGGER IN RUN 3

# BELLE VERSUS LHCb

Example:  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

✓ Two handles:  $B$  mass and  $B$  energy in  $\Upsilon(4S)$  frame ( $\Delta E$ )

185 signal decays with  $711 \text{ fb}^{-1}$

✓ Two handles:  $B$  mass and pointing to PV

2400 signal decays with  $3 \text{ fb}^{-1}$  at 7–8 TeV

Conversion factor:  $5 \text{ ab}^{-1} \leftrightarrow 1 \text{ fb}^{-1}$  (at 13 TeV)

# BELLE VERSUS LHCb

Example:  $B^0 \rightarrow K^{*0} e^+ e^-$

✓ Electron channels are as “easy” as muonic

127 signal decays with  $711 \text{ fb}^{-1}$

✗ Bremsstrahlung makes electrons much more difficult

200 signal decays with  $3 \text{ fb}^{-1}$  at 7–8 TeV

Conversion factor:  $1 \text{ ab}^{-1} \leftrightarrow 1 \text{ fb}^{-1}$  (at 13 TeV, upgraded)

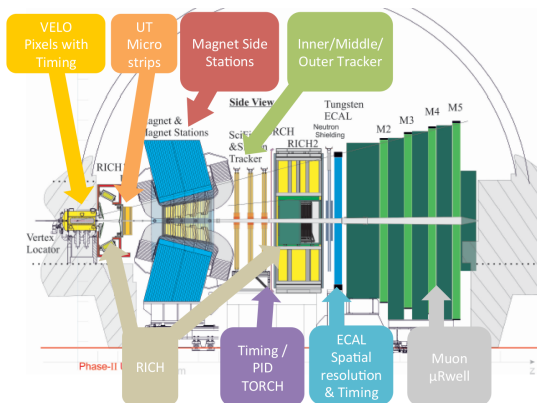

# LHC SCHEDULE

# EOI FOR PHASE-II UPGRADE

We have expressed an interest for a Phase-II upgrade [\[CERN-LHCC-2017-003\]](#) .

We are now writing the physics case.

Luminosity increments	Run 1 2010–12	Run 2 2015–18	Run 3 2021–24	Run 4 2026–30	Run 5 2032–35
$\Delta\mathcal{L}$ [ $\text{fb}^{-1}$ ]	+3	+6	+14	+27	+250
Total $\mathcal{L}$ [ $\text{fb}^{-1}$ ]	3	9	23	50	300
