HotQuarks 2018 September

- 1 Introduction
 - Conflict
- 2 Angantyr: a model for heavy-ion physics in Pythia8
 - Angantyr in Nutshell
- 3 Results
- 4 Summary

What is Angatyr?

- Key observations from HI experiments : Collectivity, flow, strangeness enhancement , jet quenching
- Unexpected observations from pp collisions : Flow and ridge like structures

- Key observations from HI experiments : Collectivity, flow, strangeness enhancement , jet quenching
 - Unexpected observations from pp collisions : Flow and ridge like structures
-
- HI event generators : Heavily rely on hydrodynamic influenced model building & are quiet successful in explaining HI physics
 - Pythia8 like MC: Does not use hydrodynamic models to simulate pp collisions & could not reproduce such observations
-

-

Can we explain physics from pp to AA without assuming QGP production?

Terminology of the game

- Wounded nucleons: Nucleons participating into interactions
- Diffractive excitations in projectile and target can also interact with nucleons in target and projectile respectively

Terminology of the game

- Wounded nucleons: Nucleons participating into interactions
- Diffractive excitations in projectile and target can also interact with nucleons in target and projectile respectively
- A participating nucleon is marked as absorptive wounded nucleon
- Interactions with diffractive excitation of such nucleons : considered as secondary absorptive collisions

Terminology of the game

- Wounded nucleons: Nucleons participating into interactions
- Diffractive excitations in projectile and target can also interact with nucleons in target and projectile respectively
- A participating nucleon is marked as absorptive wounded nucleon
- Interactions with diffractive excitation of such nucleons : considered as secondary absorptive collisions
- We modified Single Diffractive(SD) events so that for various η bins and at given impact parameter these events look alike secondary absorptive events

- A participating nucleon is marked as absorptive wounded nucleon
- Interactions with diffractive excitation of such nucleons : considered as secondary absorptive collisions
- We modified Single Diffractive(SD) events so that for various η bins and at given impact parameter these events look alike secondary absorptive events
- ND : Non-diffractive : Minimum bias : absorptive

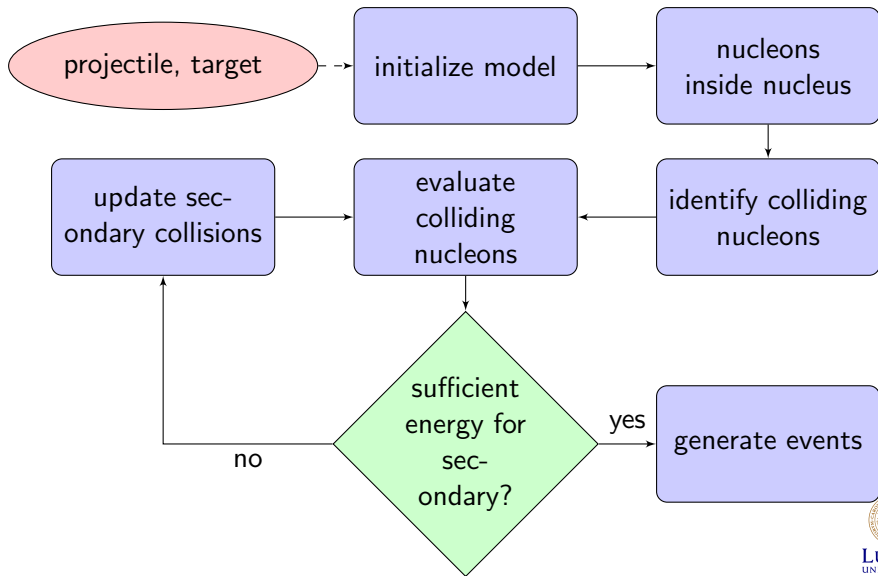

A schematics of multi-nucleon collision

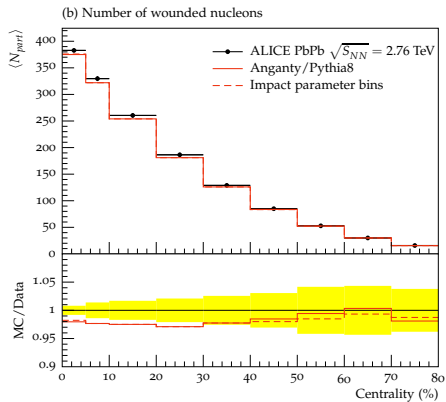

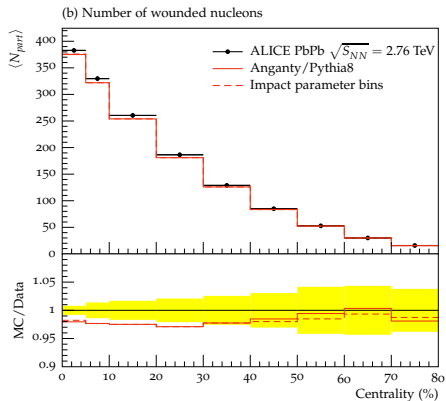

Angantyr in Nutshell

- The **Angantyr** model for heavy-ion physics, is implemented in the Pythia8¹
- The model includes fluctuations in initial state and it generates hadronic final states of multi-nucleon collisions without assuming thermalized plasma
- It is able to provide a good description of general final state properties comparable to experimental results (arxiv:1805.04432v1)

¹arxiv:1806.10820v1
