Connection between ν -A and e -A reactions

(a) Electromagnetic scattering

(b) Charged-current scattering

(c) Neutral-current scattering

$l = e, \mu, \tau$

- Experimental conditions are different:
 - ➔ (e, e') : E_e is well determined and different channels can be clearly identified by knowing the energy and momentum transfer
 - ➔ $CC(\nu_l, l)$: E_ν is broadly distributed in the neutrino beam and different channels and nuclear effects can contribute to the same kinematics of the outgoing lepton
- From a theoretical framework, neutrino- and electron-nucleus scattering are obviously connected (CVC) to each other and a **reliable model** must be able to describe both processes.
- Neutrinos can probe both the **vector** and **axial** nuclear responses, unlike electrons which are only sensitive to the vector response.

⇒ Although not sufficient to fully constrain neutrino cross sections, electron scattering constitutes a **necessary test and a solid benchmark for nuclear models**.

Theoretical description: ν -nucleus cross section

Double differential cross section

 $\chi = +(-) \equiv \nu_\mu(\bar{\nu}_\mu)$

$$\left[\frac{d\sigma}{dk_\mu d\Omega_\mu} \right]_\chi = \frac{|\vec{k}_f|}{|\vec{k}_{\nu_f}|} \frac{G_F^2}{4\pi^2} \tilde{\eta}_{\mu\nu} \tilde{W}^{\mu\nu} = \sigma_0 \mathcal{F}_\chi^2 \quad ; \quad \sigma_0 = \frac{(G_F^2 \cos^2 \theta_c)^2}{2\pi^2} \left(k_\mu \cos \frac{\tilde{\theta}}{2} \right)^2$$

Nuclear structure information

$$\mathcal{F}_\chi^2 = V_L R_L + V_T R_T + \chi [2V_{T'} R_{T'}]$$

$$V_L R_L = V_{CC} R_{CC} + 2V_{CL} R_{CL} + V_{LL} R_{LL}$$

$$R_L = R_L^{VV} + R_L^{AA} \quad ; \quad R_T = R_T^{VV} + R_T^{AA} \quad ; \quad R_{T'} = R_{T'}^{VA}$$

Nuclear responses R_K can be calculated in terms of the single nucleon ones G_K and the nuclear dependence of the model $\Rightarrow R_K \approx F(\text{nuclear}) \cdot G_K$

$$\begin{aligned} R_{CC} &= W^{00} \\ R_{CL} &= -\frac{1}{2} (W^{03} + W^{30}) \\ R_{LL} &= W^{33} \\ R_T &= W^{11} + W^{22} \\ R_{T'} &= -\frac{i}{2} (W^{12} - W^{21}) \end{aligned}$$

Comparison with (e, e') reactions

$$\left[\frac{d\sigma}{dk_\mu d\Omega} \right] = \sigma_{Mott} (v_L R_L^{VV} + v_T R_T^{VV}) \quad ; \quad \sigma_{Mott} = \frac{\alpha^2 \cos^2 \theta/2}{4E_i \sin^4 \theta/2}$$

SuperScaling Approach (SuSA)

(see [G.D. Megias' Thesis](#) for details)

► The analysis of the large amount of existing (e, e') data at different kinematics is a solid benchmark to **test** the validity of theoretical models for neutrino reactions as well as to study the nuclear dynamics. The **SuperScaling Approach** exploits **universal features** of lepton-nucleus scattering to connect the two processes.

$$f(\psi) \equiv f(q, \omega) \sim \frac{\sigma_{QE}(\text{nuclear effects})}{\sigma_{\text{single nucleon}}(\text{no nuclear effects})} ; \quad f_L = k_F R_L / G_L ; \quad f_T = k_F R_T / G_T$$

In inclusive QE scattering we can observe:

- ☆ Scaling of 1st kind (independence on q)
- ☆ Scaling of 2nd kind (independence on Z)

⇒

SuperScaling

SuperScaling Approach (SuSA)

(see [G.D. Megias' Thesis](#) for details)

► The analysis of the large amount of existing (e, e') data at different kinematics is a solid benchmark to **test** the validity of theoretical models for neutrino reactions as well as to study the nuclear dynamics. The **SuperScaling Approach** exploits **universal features** of lepton-nucleus scattering to connect the two processes.

In inclusive QE scattering we can observe:

- ☆ Scaling of 1st kind (independence on q)
- ☆ Scaling of 2nd kind (independence on Z)

SuperScaling

$$f(\psi') = k_F \frac{\left(\frac{d^2\sigma}{d\Omega_e d\omega} \right)_{exp}}{\sigma_{Mott} (v_L G_L^{ee'} + v_T G_T^{ee'})}$$

Good superscaling behavior at $\psi' < 0$ (below QE peak). At higher kinematics (ψ'), other contributions beyond QE and IA (2p2h, Δ , etc.) can play an important role and scaling is broken.

Separate L/T scaling functions

$$f_L = k_F R_L / G_L$$

$$f_T = k_F R_T / G_T$$

Scaling violations in the T channel \Rightarrow 2p-2h MEC, correlations, Δ -resonance \Rightarrow Mainly transverse

SuSA model: a semiphenomenological approach

- ★ Extracted from the (e, e') longitudinal scaling data
- ★ Assumption $f_L(\psi) = f_T(\psi)$ (as in most IA models)

★ It is experimentally observed $f_{T,exp}^{ee'} > f_{L,exp}^{ee'}$ (15-20%)

Testing SuperScaling for $^{12}\text{C}(e, e')$ in different nuclear models

Testing SuperScaling for $^{12}\text{C}(e, e')$ in different nuclear models

The SuSAv2 model

PRC90, 035501 (2014)

PRD94, 013012 (2016)

★ **SuSAv2 model:** lepton-nucleus reactions addressed within the **SuperScaling Approach** and the sophisticated **Relativistic Mean Field (RMF)** theory (FSI) to determine theoretical scaling functions that reproduce nuclear dynamics. Complete set of scaling functions for all lepton-nucleus reaction channels (EM, weak, L/T, isovector/isoscalar, V/A).

★ **RMF:** Good description of the QE (e, e') data and **superscaling properties** ($f_{L,exp}^{ee'}$).

RMF predicts $f_T > f_L$ ($\sim 20\%$) as a pure relativistic effect (distortion of the lower components of the outgoing Ψ_N by the FSI with the residual nucleus).

RMF-FSI: Scattered nucleon w.f. is solution of Dirac eq. in presence of the same potentials used to describe the bound nucleon w.f.

2p-2h MEC for (e, e') and CC ν reactions PRD91, 073004 (2015)

Over 100,000 terms are involved in the calculation, with seven-dimensional integrations

- ✦ The 2p-2h model is based on the calculation performed by De Pace et al., (2003) for (e, e') scattering and extended to the weak sector by Amaro, Ruiz Simo et al. [PRD 90, 033012 (2014); PRD 90, 053010 (2014); JPG 44, 065105 (2017); PLB 762, 124 (2016)].

- ★ Separation into pp , nn and np pairs in the FS \Rightarrow also valid for $N \neq Z$ (^{40}Ar , ^{56}Fe , ^{208}Pb)

2p2h for (e, e') processes \Rightarrow 2p2h in CC (ν, l) reactions

$R_T^{AA} > R_T^{VV}$ at $q < 800$ MeV/c
 $R_T^{AA} < R_T^{VV}$ at $q > 800$ MeV/c
 $\Rightarrow \sigma(T_{AA}) \sim \sigma(T_{VV})$ but not
 for all lepton kinematics (see Mini-BooNE $\bar{\nu}_\mu d^2\sigma$, right panels).

$R_T^{VV}(e, e') \rightarrow R_T^{VV}(\nu, l)$
 $R_T^{VV}(e, e') \not\rightarrow R_T^{AA}, R_T^{VA}(\nu, l)$

$R_L^{VV}(e, e')$ negligible but not
 $R_L(\nu, l)$ because of $R_L^{AA}(\nu, l)$.
 Highly relevant for antineutrino
 reactions ($\sigma_{T'}^{VA} < 0$).

2p-2h implementation in MC event generators (PRELIMINARY)

Monte Carlo (MC) generators serve as a **bridge** between **theoretical models** and **experimental measurements**.

Sophisticated models in MC simulations \Rightarrow Accurate reconstruction of event topology (FS particles and kinematics ID) and inference of E_ν .

T2K CC0 π data on ^{12}C

Characterization of nuclear effects at T2K ($E_\nu \sim 0.8$ GeV) (PRELIMINARY)

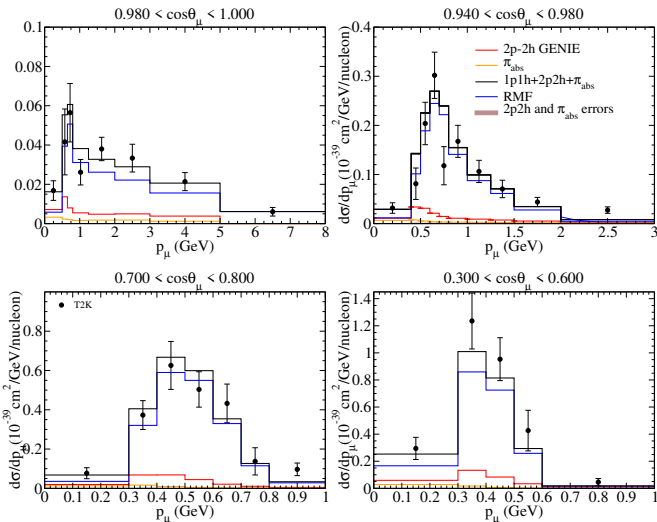

Neutrino oscillation measurements and E_ν^{rec} affected by large nuclear-medium uncertainties \Rightarrow **T2K CC0 π Np data** \Rightarrow novel probe of nuclear-medium effects through p kinematics, nucleon multiplicity and p and μ kinematic imbalances.

THE FUTURE IS SEMI-INCLUSIVE \Rightarrow Best way to produce consistent theory-vs-data comparison. Less dependency on simulations and deeper analysis of model nuclear effects.

PROBLEM: Current lack of semi-inclusive models and proper implementation in generators.

Different models can give similar inclusive CS but different semi-inclusive ones.

Semi-inclusive \Rightarrow Inclusive (but not viceversa).

“Semi-semi-inclusive” T2K CC0 π Np data on ^{12}C with $0p$ above 500 MeV/c

SuSAv2 model: Scaling phenomenon and RMF theory

SuSAv2: Neutrino-nucleus reactions addressed within the SuperScaling Approach and the RMF theory in order to reproduce nuclear dynamics.

SuperScaling Approach (SuSA)

[Amaro et al., PRC71 (2005)]

- Many high-quality $e - A$ data exist, which must be used to **test** models as well as an **input** for predicting $\nu - A$ observables. The **SuperScaling Approach** exploits **universal features** of lepton-nucleus scattering to connect the two processes.
- In most IA models (RFG, RMF, RPWIA) the inclusive lepton-nucleus cross section factorizes into a single-nucleon cross section times a specific function of (q, ω) which embodies the nuclear dynamics.

$$f(\psi) \equiv f(q, \omega) \sim \frac{\sigma_{QE}(\text{nuclear effects})}{\sigma_{\text{single nucleon}}(\text{no nuclear effects})} ; \quad \psi\text{-scaling variable}$$

- In some situations this function **scales** $f(\omega, q)$, becoming dependent on a single **scaling variable** $\psi = \psi(\omega, q) \Rightarrow f(\psi)$. (ex: Bjorken scaling)
- This scaling function $f(\psi)$ can be related to the momentum distribution of the nucleons in the nucleus under some approaches.

In inclusive QE scattering we can observe two kinds of scaling [Donnelly and Sick, PRL82 & PRC60 (1999)]:

- ☆ Scaling of 1st kind (independence on q)
- ☆ Scaling of 2nd kind (independence on Z)

\Rightarrow

SuperScaling

Theoretical description: RMF and SuSAv2 models

The SuSAv2 model

PRC90, 035501 (2014)

PRD94, 013012 (2016)

- ★ In the SuSAv2, the scaling functions are calculated within the Relativistic Mean Field model (FSI), which predicts, for instance, different scaling functions in the L and T channels and for the different isospin channels (CCν reactions are purely isovector).
- ★ RMF: Good description of the QE (e,e') data and superscaling properties ($f_{L,exp}^{ee'}$)
- ★ RMF predicts $f_T > f_L$ (~ 20%) as a pure relativistic effect (distortion of the lower components of the outgoing Ψ_N by the FSI with the residual nucleus)

$$R_{L,T}^{ee'} = \frac{1}{k_F} \left[f_{L,T}^{T=1,ee'}(\psi') G_{L,T}^{T=1} + f_{L,T}^{T=0,ee'}(\psi') G_{L,T}^{T=0} \right]$$

$$R_L^{VV,\nu(\bar{\nu})} = \frac{1}{k_F} f_L^{VV,\nu(\bar{\nu})}(\psi') G_L^{VV}$$

$$R_{CC,CL,LL}^{AA,\nu(\bar{\nu})} = \frac{1}{k_F} f_{CC,CL,LL}^{AA,\nu(\bar{\nu})}(\psi') G_{CC,CL,LL}^{AA}$$

$$R_T^{VV(AA),\nu(\bar{\nu})} = \frac{1}{k_F} f_T^{VV(AA),\nu(\bar{\nu})}(\psi') G_T^{VV(AA)}$$

$$R_{T'}^{\nu(\bar{\nu})} = \frac{1}{k_F} f_{T'}^{VA,\nu(\bar{\nu})}(\psi') G_{T'}^{VA}$$

Theoretical description: RMF and SuSAv2 models

The SuSAv2 model

PRC90, 035501 (2014)

PRD94, 013012 (2016)

★ **SuSAv2 model:** lepton-nucleus reactions addressed within the **SuperScaling Approach** and the sophisticated **Relativistic Mean Field (RMF)** theory (FSI) to determine theoretical scaling functions that reproduce nuclear dynamics. Complete set of scaling functions for all lepton-nucleus reaction channels (EM, weak, L/T, isovector/isoscalar, V/A).

★ **RMF:** Good description of the QE (e, e') data and **superscaling properties** ($f_{L,exp}^{ee'}$)

Extension of the SuSAv2-MEC model to other nuclei

SuSAv2 scaling functions for different nuclei

- ➔ 2-nd kind scaling within the RMF and RPWIA models.
- ➔ k_F and E_{shift} are the only different parameters.

Density dependence of the 2p-2h MEC responses

☆ Most existing calculations of 2p-2h MEC refer to ^{12}C , but other nuclei are interesting for oscillation experiments (^{16}O , ^{40}Ar) \Rightarrow Extension of the 2p-2h MEC analysis to other nuclei

☆ In the RFG and in the SuSAv2-MEC model, each nucleus is characterized by two parameters: k_F and E_{shift} , fitted to reproduce the width and position of the QEP in inclusive electron scattering.

TABLE I. Adjusted parameters.

Nucleus	k_F (MeV/c)	E_{shift} (MeV)
Lithium	165	15
Carbon	228	20
Magnesium	230	25
Aluminum	236	18
Calcium	241	28
Iron	241	23
Nickel	245	30
Tin	245	28
Gold	245	25
Lead	248	31

Maieron, Donnelly, Sick, PRC65 (2002)

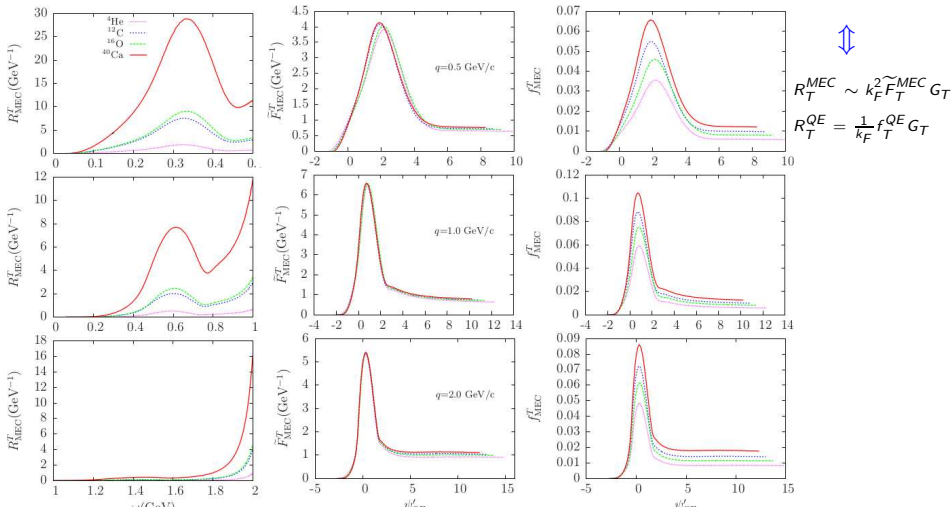

☆ A-scaling (2^{nd} kind) on 2p-2h MEC responses? \Rightarrow A description of 2p-2h MEC responses in terms of k_F allow to extend easily our calculation to other nuclei reducing significantly the computational time.

Density dependence of 2p-2h MEC [PRC95, 065502 (2017)]

$$\widetilde{F}_T^{MEC}(q, \omega) \equiv \frac{m_N^2 R_T^{MEC}(q, \omega)}{k_F^2 G_T(\tau)} ; f_T^{MEC}(q, \omega) \equiv \frac{k_F R_T^{MEC}(q, \omega)}{m_N G_T(\tau)}$$

\Rightarrow 2p-2h responses scales as $A \cdot k_F^2$
 whereas the QE one scales as A/k_F

Density dependence of 2p-2h MEC [PRC95, 065502 (2017)]

$$\psi'_{MEC}(q, \omega, k_F)$$

➔ Analysis of experimental scaling (e, e') data.

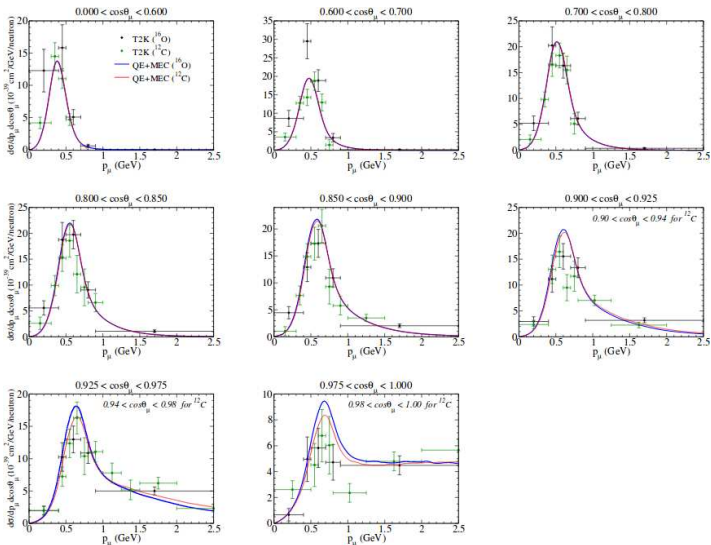

Energy shift and Fermi momentum in RFG and SuSAv2 models

- ➔ E_{shift} : small energy shift included to have the QE peak at $\psi' = 0$ ($\omega = |Q^2|/2m_N$). It is a phenomenological way to introduce in ψ the separation energy, $E_s \sim$ (binding energy), the difference between the sum of the nucleon plus ground-state daughter masses and the target ground state-mass. This E_s actually implies a small shift.
- ➔ k_F and E_{shift} for RFG and SuSA models are obtained from global fits to (e, e') data for different nuclei. In the SuSAv2 model, we introduce a soft q -dependence in E_{shift} due to the strong potentials at higher kinematics coming from RMF theory.

Sensitivity of the SuSAv2-MEC model

Relevant kinematic regions in the QE cross section

The main contribution to the total QE CS comes from $q < 1 \text{ GeV/c}$ and $\omega < 0.5 \text{ GeV}$, even at high neutrino energies.

Relevant kinematic regions in the QE cross section

The main contribution to the total QE CS comes from $q < 1 \text{ GeV}/c$ and $\omega < 0.5 \text{ GeV}$, even at high neutrino energies.

Relevant kinematic regions in the 2p-2h MEC cross section

Although very similar to the QE case, the relevance of 2p-2h MEC contributions extends slightly to higher kinematics.

2p-2h MEC parametrization *PRD91, 073004 (2015) PRD94, 093004 (2016)*

$$R_X^{2p-2hMEC}(\psi', q) = \frac{2a_{3,X} e^{-\frac{(\psi' - a_{4,X})^2}{a_{5,X}}} + \sum_{k=0}^2 b_{k,X} \cdot (\psi')^k}{1 + e^{-\frac{(\psi' - a_{1,X})^2}{a_{2,X}}}}$$

$X = CC, CL, LL, T(= T_{VV} + T_{AA}), T'_{VA}$

$a_{i,X}(q), b_{k,X}(q)$

QE+MEC+ Δ contributions in $\nu_\mu - {}^{12}\text{C}$ scattering

Analysis of T2K ν_μ data ($\langle E_{\nu_\mu} \rangle \sim 0.8$ GeV)

JPG 43, 045101 (2016)

- Deep Inelastic Scattering contributions are not relevant at T2K kinematics.
- Work in progress to include the DIS description \Rightarrow analysis of higher-energy data.

T2K $\nu_e - {}^{12}\text{C}$ cross sections

Analysis of T2K ν_e data ($\langle E_{\nu_e} \rangle \sim 1.3$ GeV)
J.Phys.G 43, 045101 (2016)

➡ Agreement with data is slightly worse as for $E_\nu \gtrsim 1$ GeV DIS starts to be relevant.

Inclusive total cross section \Rightarrow Δ -scaling model

Extension of the SuSA into the non-QE region assuming Δ -resonance dominance [*J.Phys.G* 43, 045101 (2016)]. Subtraction of the QE + 2p-2h MEC contributions from the total CS.

QE+MEC+ Δ contributions are not enough to describe inclusive cross section at $E_\nu \gtrsim 1$ GeV \Rightarrow Work in progress to include DIS in the ν interaction model.

➡ RFG as a natural starting point to examine the scaling concept

$$\frac{d^2\sigma}{d\Omega_e d\omega} = \sigma_0 \mathcal{F}_X^2 = \sigma_0 (V_L R_L^{VV} + V_{CC} R_{CC}^{AA} + 2V_{CL} R_{CL}^{AA} + V_{LL} R_{LL}^{AA} + V_T R_T + \chi V_{T'} R_{T'})$$

$$\frac{d^2\sigma}{d\Omega_e d\omega} = \sigma_{Mott} (v_L R_L^{ee'} + v_T R_T^{ee'})$$

$$R_K^{QE} = \frac{1}{k_F} f_{RFG}(\psi') \frac{\mathcal{N}}{2\kappa \mathcal{D}} U_K^{s.n.} \equiv \frac{1}{k_F} f_{RFG}(\psi') G_K, \quad K = CC, CL, LL, T, T'$$

$$f_{RFG}(\psi') = \frac{3}{4} (1 - \psi'^2) \theta(1 - \psi'^2)$$

$$\psi' \equiv \frac{1}{\sqrt{\xi_F}} \frac{\lambda' - \tau'}{\sqrt{(1 + \lambda')\tau' + \kappa \sqrt{\tau'(\tau' + 1)}}$$

$$\lambda' = \omega' / (2M_N), \quad \kappa = q / (2M_N)$$

$$\omega' = \omega - E_{shift}, \quad \tau' = \kappa^2 - \lambda'^2$$

Scaling functions can be extracted from experimental data or different nuclear models.

$$R_K^{QE} = \frac{1}{k_F} f_{model}(\psi') \frac{\mathcal{N}}{2\kappa\mathcal{D}} U_K^{s.n.} \equiv \frac{1}{k_F} f_{model}(\psi') G_K, \quad K = CC, CL, LL, T, T'$$

- Scaling functions obtained from the cross section:

$$f^{QE(e,e')} = k_F \frac{\frac{d^2\sigma}{d\Omega_e d\omega}}{\sigma_{Mott}(v_L G_L^{ee'} + v_T G_T^{ee'})}$$

$$f^{QE(\nu)} = k_F \frac{\frac{d^2\sigma}{d\Omega_I d\omega}}{\sigma_0(v_L G_L^{VV} + V_{CC} G_{CC}^{AA} + 2V_{CL} G_{CL}^{AA} + V_{LL} G_{LL}^{AA} + v_T G_T + \chi v_{T'} G_{T'})}$$

- Specific scaling functions for the individual channels:

$$f_K = k_F \frac{R_K}{G_K}$$

2p-2h MEC channels at MiniBooNE kinematics

$\nu_\mu \Rightarrow$

$\bar{\nu}_\mu \Rightarrow$

Relevant kinematic regions at $E_\nu = 3$ GeV

QE

2p-2h MEC

Although very similar to the QE case, the relevance of 2p-2h MEC contributions extends slightly to higher kinematics.

Theoretical description: CCQE ν -nucleus cross section

Double differential cross section

$$\chi = +(-) \equiv \nu_\mu(\bar{\nu}_\mu)$$

$$\left[\frac{d\sigma}{dk_\mu d\Omega_\mu} \right]_\chi = \frac{|\vec{k}_l|}{|\vec{k}_{\nu l}|} \frac{G_F^2}{4\pi^2} \tilde{\eta}_{\mu\nu} \tilde{W}^{\mu\nu} = \sigma_0 \mathcal{F}_\chi^2 \quad ; \quad \sigma_0 = \frac{(G_F^2 \cos^2 \theta_c)^2}{2\pi^2} \left(k_\mu \cos \frac{\bar{\theta}}{2} \right)^2$$

Nuclear structure information

$$\mathcal{F}_\chi^2 = V_L R_L + V_T R_T + \chi [2V_{T'} R_{T'}]$$

$$V_L R_L = V_{CC} R_{CC} + 2V_{CL} R_{CL} + V_{LL} R_{LL}$$

$$L \rightarrow (\mu\nu) = (00, 03, 30, 33);$$

$$T \rightarrow (11, 22); T' \rightarrow (12, 21)$$

$$R_L = R_L^{VV} + R_L^{AA} \quad ; \quad R_T = R_T^{VV} + R_T^{AA} \quad ; \quad R_{T'} = R_{T'}^{VA}$$

Nuclear responses

Composed of VV (vector-vector), AA (axial-axial) and VA (vector-axial) components arising from the V and A weak leptonic and hadronic currents: $j^\mu = j_V^\mu + j_A^\mu \quad ; \quad J^\mu = J_V^\mu + J_A^\mu$.

Theoretical description: CCQE ν -nucleus cross section

Double differential cross section

$$\chi = +(-) \equiv \nu_\mu(\bar{\nu}_\mu)$$

$$\left[\frac{d\sigma}{dk_\mu d\Omega_\mu} \right]_\chi = \frac{|\vec{k}_l|}{|\vec{k}_{\nu_l}|} \frac{G_F^2}{4\pi^2} \tilde{\eta}_{\mu\nu} \tilde{W}^{\mu\nu} = \sigma_0 \mathcal{F}_\chi^2 \quad ; \quad \sigma_0 = \frac{(G_F^2 \cos^2 \theta_c)^2}{2\pi^2} \left(k_\mu \cos \frac{\tilde{\theta}}{2} \right)^2$$

Nuclear structure information

$$\mathcal{F}_\chi^2 = V_L R_L + V_T R_T + \chi [2V_{T'} R_{T'}]$$

$$V_L R_L = V_{CC} R_{CC} + 2V_{CL} R_{CL} + V_{LL} R_{LL}$$

$$L \rightarrow (\mu\nu) = (00, 03, 30, 33);$$

$$T \rightarrow (11, 22); T' \rightarrow (12, 21)$$

$$R_L = R_L^{VV} + R_L^{AA} \quad ; \quad R_T = R_T^{VV} + R_T^{AA} \quad ; \quad R_{T'} = R_{T'}^{VA}$$

$$\begin{aligned} R_{CC} &= W^{00} \\ R_{CL} &= -\frac{1}{2} (W^{03} + W^{30}) \\ R_{LL} &= W^{33} \\ R_T &= W^{11} + W^{22} \\ R_{T'} &= -\frac{i}{2} (W^{12} - W^{21}) \end{aligned}$$

Elastic vs. QE responses

In general, each nuclear response R_K can be calculated in terms of the single nucleon contribution G_K times the nuclear dependence of the model $\Rightarrow R_K \approx F(\text{nuclear}) \cdot G_K$

Theoretical description: CCQE ν -nucleus cross section

Double differential cross section

$$\chi = +(-) \equiv \nu_\mu(\bar{\nu}_\mu)$$

$$\left[\frac{d\sigma}{dk_\mu d\Omega_\mu} \right]_\chi = \frac{|\vec{k}_f|}{|\vec{k}_{\nu f}|} \frac{G_F^2}{4\pi^2} \tilde{\eta}_{\mu\nu} \tilde{W}^{\mu\nu} = \sigma_0 \mathcal{F}_\chi^2 \quad ; \quad \sigma_0 = \frac{(G_F^2 \cos^2 \theta_c)^2}{2\pi^2} \left(k_\mu \cos \frac{\bar{\theta}}{2} \right)^2$$

Nuclear structure information

$$\mathcal{F}_\chi^2 = V_L R_L + V_T R_T + \chi [2V_{T'} R_{T'}]$$

$$V_L R_L = V_{CC} R_{CC} + 2V_{CL} R_{CL} + V_{LL} R_{LL}$$

$$L \rightarrow (\mu\nu) = (00, 03, 30, 33);$$

$$T \rightarrow (11, 22); T' \rightarrow (12, 21)$$

$$R_L = R_L^{VV} + R_L^{AA}; R_T = R_T^{VV} + R_T^{AA}; R_{T'} = R_{T'}^{VA}$$

$$R_{CC} = W^{00}$$

$$R_{CL} = -\frac{1}{2} (W^{03} + W^{30})$$

$$R_{LL} = W^{33}$$

$$R_T = W^{11} + W^{22}$$

$$R_{T'} = -\frac{i}{2} (W^{12} - W^{21})$$

Comparison with (e, e') reactions

$$\left[\frac{d\sigma}{dk_\mu d\Omega} \right] = \sigma_{Mott} (v_L R_L^{VV} + v_T R_T^{VV}) \quad ; \quad \sigma_{Mott} = \frac{\alpha^2 \cos^2 \theta/2}{4E_i \sin^4 \theta/2}$$

T2K systematics today and needs for HyperK and DUNE

- Global experimental systematics in T2K are around a 4% (7%) for ν_μ (ν_e) reactions and are dominated by cross section uncertainties (3%) \Rightarrow It is essential to improve description of neutrino interaction physics.
- Oscillation measurements in future experiments (HyperK, DUNE) aim to $\sim 1 - 3\%$ systematic uncertainty and determine mass hierarchy and δ_{CP} violation phase.

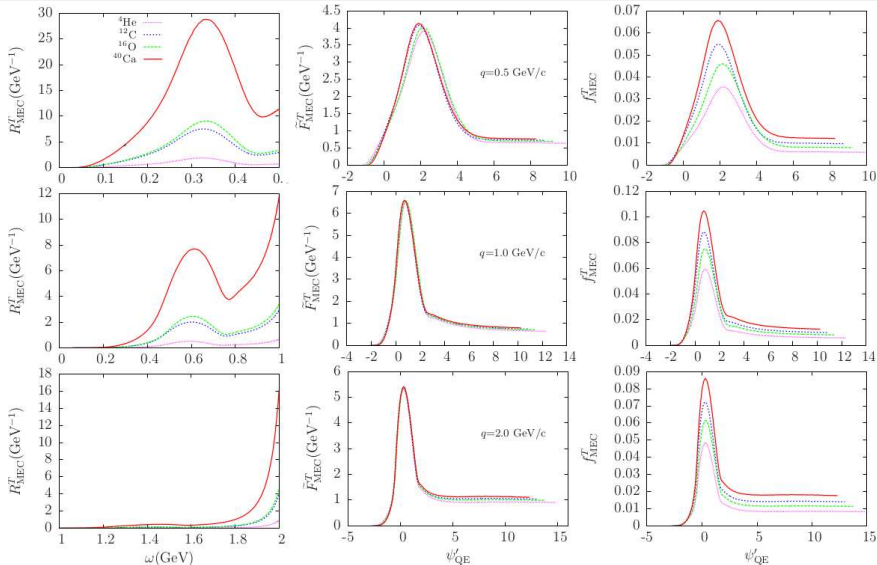

It is faster and cheaper to pay a theoretician to reduce 2% your systematics than building new huge detectors!

Conclusions and Further Work

- The validation against electron scattering data is a solid benchmark to assess the validity of nuclear models for the analysis of neutrino experiments. Superscaling is a valuable tool to connect electron and neutrino scattering.
- Satisfactory comparison of the SuSAv2-MEC model with (e, e') and (ν, l) data for different nuclei (^{12}C , ^{16}O and ^{40}Ca).
- The SuSAv2-MEC model can be easily described for different nuclei, translating sophisticated and computationally demanding microscopic calculations into a straightforward formalism and, hence, easing its implementation in MonteCarlo simulations used in ν oscillation experiments (GENIE, *in progress*). MC generators serve as a bridge between theoretical models and experimental measurements.
- Works in progress: Inclusive neutrino scattering including all inelasticities (DIS).
- Extension to asymmetric nuclei ($Z \neq N$), ^{40}Ar or ^{56}Fe , will be provided by supplying the separate RMF n and p scaling functions and the 2p-2h charge channel contributions, pn , pp and nn emission.
- SuSAv2 model integrates over the FS hadronic kinematics but they can be analyzed from the RMF theory \Rightarrow Analysis of semi-inclusive reactions (more sensitive to nuclear model details) should help to analyze physics of theoretical models. Different models can give similar inclusive CS but probably different exclusive ones. Work in progress on $(e, e'N)$ RMF \rightarrow (ν, l^-N) RMF.

Characterization of nuclear effects at T2K experiment (PRELIMINARY)

- Next step: Analysis of **transverse variables** (T2K, MINER ν A) within the SuSAv2-MEC model.
- **Transverse variables**: more sensitive to different nuclear effects and useful to disentangle initial state (initial momentum distribution, in medium modifications) from final state (rescattering) effects.

Characterization of nuclear effects at T2K experiment (PRELIMINARY)

➤ Next step: Analysis of **transverse variables** (T2K, MINER ν A) within the SuSAv2-MEC model.

➤ **Transverse variables**: more sensitive to different nuclear effects and useful to disentangle initial state (initial momentum distribution, in medium modifications) from final state (rescattering) effects.

➤ **THE FUTURE IS SEMI-INCLUSIVE** \Rightarrow Less dependency on simulations and deeper analysis of model nuclear effects. **PROBLEM: Current lack of semi-inclusive models and proper implementation in generators.**

Relativity is essential in 2p2h models

JPG 44, 065105 (2017)

Relativity is essential in 2p2h models

PRD90, 033012 (2014)

- ★ Effect of implementing relativistic kinematics in a non-relativistic calculation of the phase-space function $F(q, \omega)$ can be delicate and misleading. Differences at high kinematics can be even larger than the ones related to a non-relativistic approach.
- ★ All 2p-2h nuclear models should “agree” at the level of $F(q, \omega)$. Good starting point for model comparison.

2p-2h MEC hadronic tensor ($W_{2p-2h}^{\mu\nu}$) and elementary hadronic tensor ($r_{2p-2h}^{\mu\nu}$) in the RFG model

$$W_{2p-2h}^{\mu\nu} = \frac{v}{(2\pi)^9} \int d^3 p'_1 d^3 h_1 d^3 h_2 \frac{M^4}{E_1 E_2 E'_1 E'_2} \Theta(p'_1, p'_2, h_1, h_2) r^{\mu\nu}(p'_1, p'_2, h_1, h_2) \delta(E'_1 + E'_2 - E_1 - E_2 - \omega)$$

$$F(q, \omega) = \int d^3 p'_1 d^3 h_1 d^3 h_2 \frac{M^4}{E_1 E_2 E'_1 E'_2} \Theta(p'_1, p'_2, h_1, h_2) \delta(E'_1 + E'_2 - E_1 - E_2 - \omega)$$

 CCQE-like = CCQE+CC2p2h
 CC0 π = CCQE-like with π absorption background
 CC1 π
 CCDIS
 ...

SuperScaling Approach (SuSA)

(see [G.D. Megias' Thesis](#) for details)

➡ The analysis of the large amount of existing (e, e') data at different kinematics is a solid benchmark to **test** the validity of theoretical models for neutrino reactions as well as to study the nuclear dynamics. The **SuperScaling Approach** exploits **universal features** of lepton-nucleus scattering to connect the two processes.

In inclusive QE scattering we can observe:

- ☆ Scaling of 1st kind (independence on q)
- ☆ Scaling of 2nd kind (independence on Z)

SuperScaling

$$f(\psi') = k_F \frac{\left(\frac{d^2\sigma}{d\Omega_e d\omega} \right)_{exp}}{\sigma_{Mott} (v_L G_L^{ee'} + v_T G_T^{ee'})}$$

Good superscaling behavior at $\psi' < 0$ (below QE peak). At higher kinematics (ψ'), other contributions beyond QE and IA (2p2h, Δ , etc.) can play an important role and scaling is broken.

SuperScaling Approach (SuSA)

(see [G.D. Megias' Thesis](#) for details)

► The analysis of the large amount of existing (e, e') data at different kinematics is a solid benchmark to **test** the validity of theoretical models for neutrino reactions as well as to study the nuclear dynamics. The **SuperScaling Approach** exploits **universal features** of lepton-nucleus scattering to connect the two processes.

In inclusive QE scattering we can observe:

- ☆ Scaling of 1st kind (independence on q)
- ☆ Scaling of 2nd kind (independence on Z)

SuperScaling

$$f(\psi') = k_F \frac{\left(\frac{d^2\sigma}{d\Omega_e d\omega} \right)_{exp}}{\sigma_{Mott} (v_L G_L^{ee'} + v_T G_T^{ee'})}$$

Good superscaling behavior at $\psi' < 0$ (below QE peak). At higher kinematics (ψ'), other contributions beyond QE and IA (2p2h, Δ , etc.) can play an important role and scaling is broken.

Relevance of direct/exchange interference in np/pp ratio

★ Effect of implementing relativistic kinematics in a non-relativistic calculation of the phase-space function $F(q, \omega)$ can be delicate and misleading. Differences at high kinematics can be even larger than the ones related to a non-relativistic approach.

★ All 2p-2h nuclear models should “agree” at the level of $F(q, \omega)$. Good starting point for model comparison.

Other Fermi Gas based 2p2h models

Martini model: Based on a non-relativistic treatment of MEC and correlations with relativistic corrections added and axial 2p2h estimated from vector one.

Nieves model: Relativistic with some approximations to compute the momentum-space integrals.

Both models neglect direct/exchange interference terms \Rightarrow strongly affects np/pp ratio by a factor ~ 2 (see PRC94, 054610 (2016)).

Density dependence of 2p-2h MEC [PRC95, 065502 (2017)]

☆ Most existing calculations of 2p-2h MEC refer to ^{12}C , but other nuclei are interesting for oscillation experiments (^{16}O , ^{40}Ar) \Rightarrow Extension of the 2p-2h MEC analysis to other nuclei

☆ A-scaling (2^{nd} kind) on 2p-2h MEC responses? \Rightarrow A description of 2p-2h MEC responses in terms of k_F allow to extend easily 2p2h calculation to other nuclei reducing significantly the computational time.

$$\tilde{F}_T^{\text{MEC}}(q, \omega) \equiv \frac{m_N^2}{k_F^2} \frac{R_T^{\text{MEC}}(q, \omega)}{G_T(\tau)} \quad ; \quad f_T^{\text{MEC}}(q, \omega) \equiv \frac{k_F}{m_N} \frac{R_T^{\text{MEC}}(q, \omega)}{G_T(\tau)}$$

\Rightarrow 2p-2h responses scales as $A \cdot k_F^2$ whereas the QE one scales as A/k_F :

$$R_T^{\text{MEC}} \sim k_F^2 \tilde{F}_T^{\text{MEC}} G_T \quad R_T^{\text{QE}} = \frac{1}{k_F} f_T^{\text{QE}} G_T$$

2p-2h MEC for (e, e') and CC ν reactions PRD91, 073004 (2015)

- ✦ The 2p-2h model is based on the calculation performed by De Pace et al., (2003) for (e, e') scattering and extended to the weak sector by Amaro, Ruiz Simo et al. [PRD 90, 033012 (2014); PRD 90, 053010 (2014); JPG 44, 065105 (2017); PLB 762, 124 (2016)].
- ✦ The numerical evaluation of the hadronic tensor $W_{2p2h}^{\mu\nu}$ is performed in the RFG model in a fully relativistic way without any approximation.
