

- New Resistive Plate Chamber (RPC) detectors*
- New Front-End Electronics for the RPCs (FEERIC project)*
- Wireless FEERIC threshold distribution*
- Readout Electronics*

❑ **Motivations**

- Precision measurements of the QGP properties during LHC run3-4
- **LoI for the ALICE Upgrade**, CERN-LHCC-2012-012, <http://cds.cern.ch/record/1475243>

❑ **Conditions**

- High interaction rate after run2: 50 kHz in Pb-Pb
- To be compared to ~10 kHz peak during LHC run2

❑ **Strategy**

- Hardware triggers not very selective in HI
 - ⇒ readout all Min-Bias and/or continuous readout
 - ⇒ online reduction (O² project)
- Large statistics : Pb-Pb at $\sqrt{s}=5.5$ TeV, $L_{INT} \sim 13 \text{ nb}^{-1}$ ($>10^{11}$ Min-Bias events)

❑ **Muon Identifier (MID) = upgrade of present Muon TRigger (MTR) system**

- **Readout and Trigger electronics TDR**, <http://cds.cern.ch/record/1603472>
- **MTR** : 72 Resistive Plate Chambers (140 m²), 21k FE ch., muon p_T based trigger decision
- **MID**
 - ⇒ **Provides muon identification** (match with MFT/MCH tracks behind thick iron wall)
 - ⇒ Continuous readout (new Readout Electronics), very reduced trigger capabilities
 - ⇒ 1/3 new RPCs, new Front-End Electronics

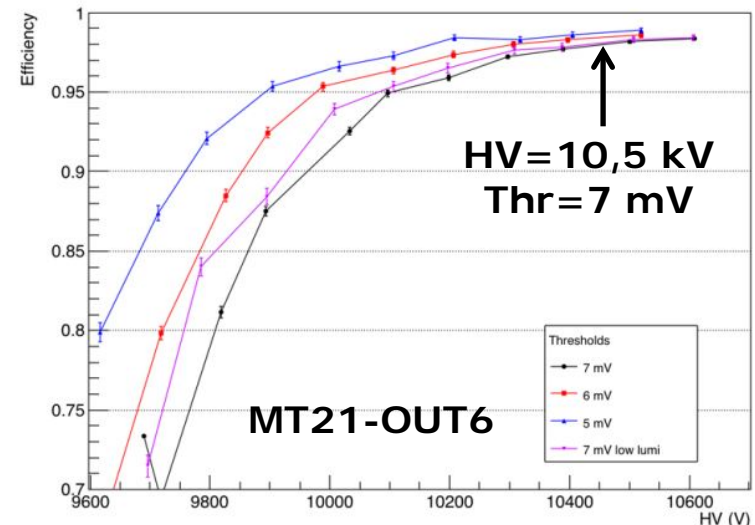

❑ **Installation during LS2 (2019-2020), data taking during LHC run3 and run4**

MTR picture

- ❑ **Goal: replace the 24 most irradiated RPCs (out of 72) and other RPCs showing ageing at the end of Run2**
- ❑ **Production status**
 - 30 RPCs produced so far
 - 20 more in production
- ❑ **Test status**
 - Ongoing, 16 RPCs already tested
 - Present yield ~70%
 - Based on the final yield, we will consider building more RPCs → if late for installation, they will be kept as spares
- ❑ **Two new RPCs installed in ALICE cavern (MT21-OUT6 and MT22-IN3) on 02/18 for long term tests in realistic conditions**
 - HV/threshold scan on 04/18
 - High efficiency and stability so far
- ❑ **Plans**
 - Mass production tests (end): 12/18
 - Installation: few weeks during 2019

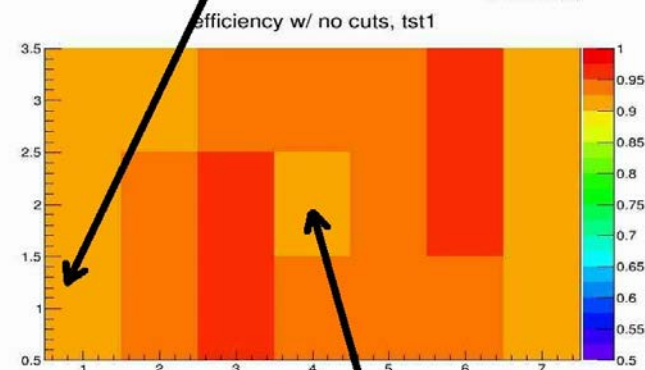

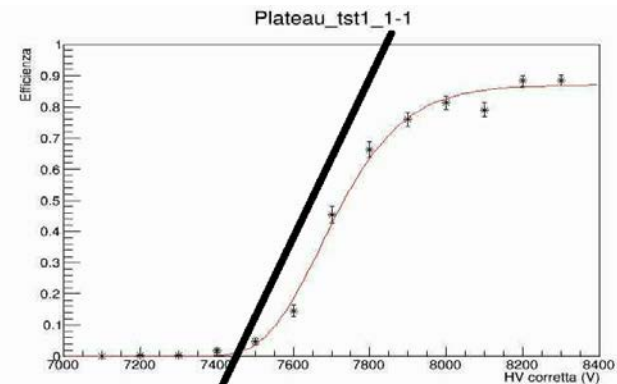

Tests carried @ Torino cosmic bench

- The detection of possible **gas leaks**
- The **current-HV curve (ramp-up)** and the detection of leakage currents
- The **efficiency-HV curve** in cells $\sim 20 \times 20 \text{ cm}^2$
- The **noise map** of the detector, with the auto-trigger method
- The **efficiency map at working HV** with a granularity of $\sim 2 \times 2 \text{ cm}^2$

efficiency w/ no cuts, tst1

Plateau_tst1_4-2

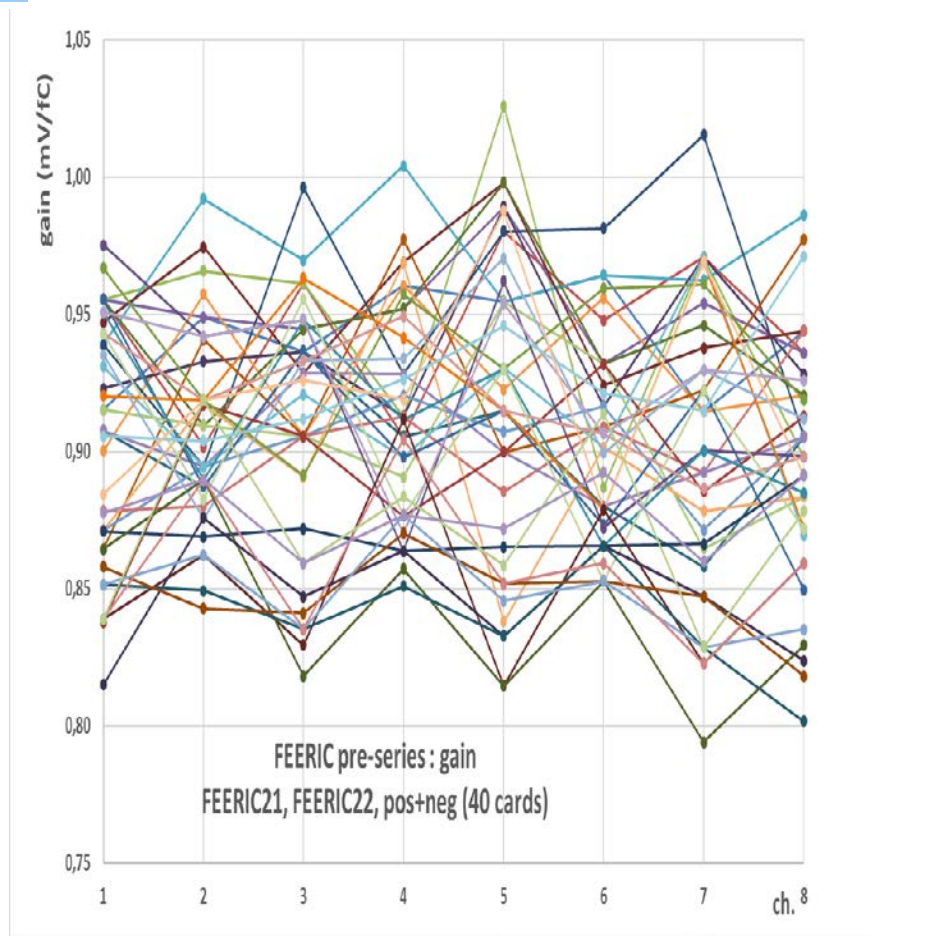

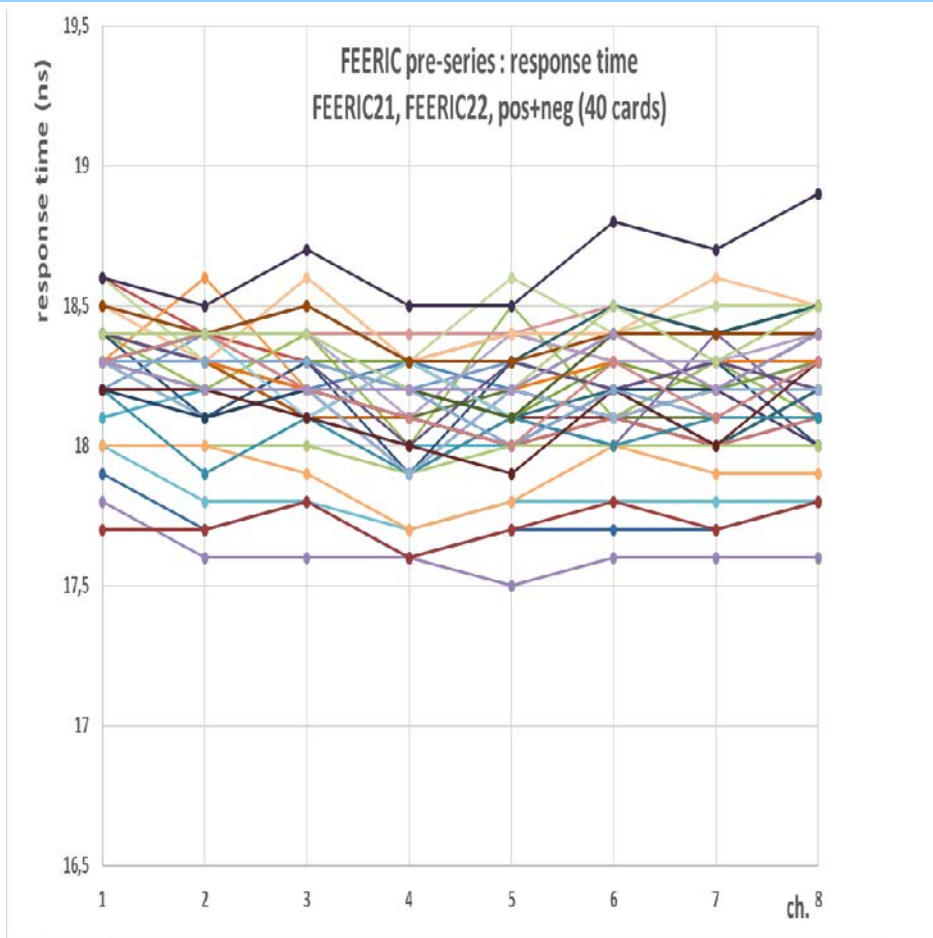

- ❑ **Goal = slow down RPC aging after LS2**
 - 20992 ch., **2384 FE cards** (+14% spares)
 - Present ASIC ADULT: no amplification
 - Future ASIC **FEERIC with amplification**
- ❑ **39 FEERIC cards on 1 (/72) RPC (MT22-IN3) in ALICE cavern since 02/15**
 - Very satisfactory performance and stability
 - **Factor 4 less charge released in the RPC gas with FEERIC => reduced aging**
 - RPC from the new production since 02/18
- ❑ **ASIC production (x5000) validated in two weeks on 06/16 using the prod. test bench**
 - **Yield > 98%**, 60% spare ASIC available
- ❑ **Card production**
 - CERN price enquiry DO-30313/EP/FEERIC
 - **Production completed** since 01/18
- ❑ **Installation of new RPCs and FEERIC cards**
 - During 2019, ~3 months, not consecutive
 - Prepa. of installation (documents, tools) ongoing

Production test bench

MID : FEERIC *sample* performance ex. of response Time and Gain dispersion

- Response time dispersion < 1,5 ns
- Response time dispersion assumed in PRR is 3 ns (for full prod.)

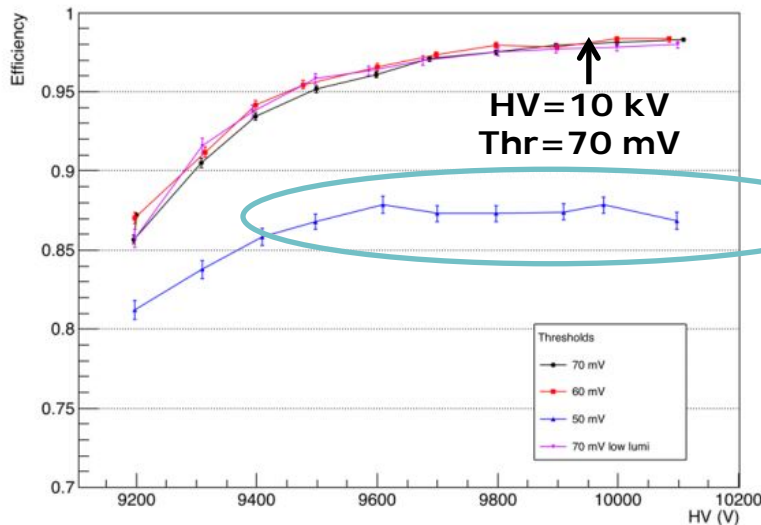

- Gain dispersion ~ ±10%

Thesis service task ongoing on analysis of **full production** dispersion

□ ***HV/threshold scan (04/18) for the RPC (MT22-IN3) from the new production equipped with FEERIC cards in ALICE cavern***

- High efficiency reached for thr=60 mV and 70 mV (in high and low lumi runs)

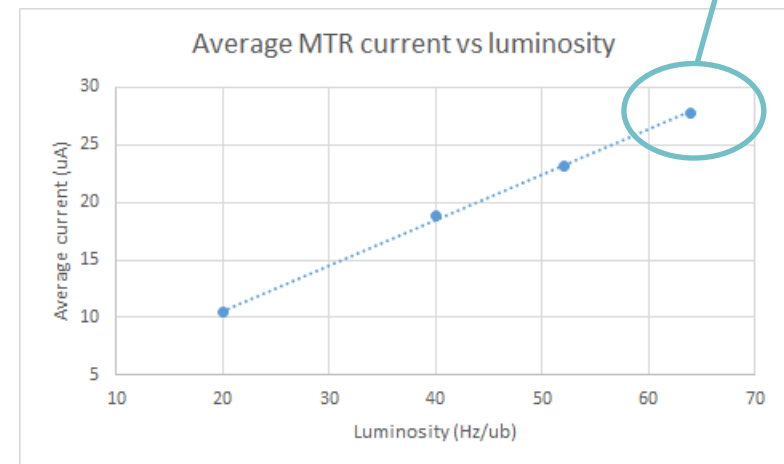

Noisy NBP area for thr=50 mV
=> drop of the overall plane efficiency

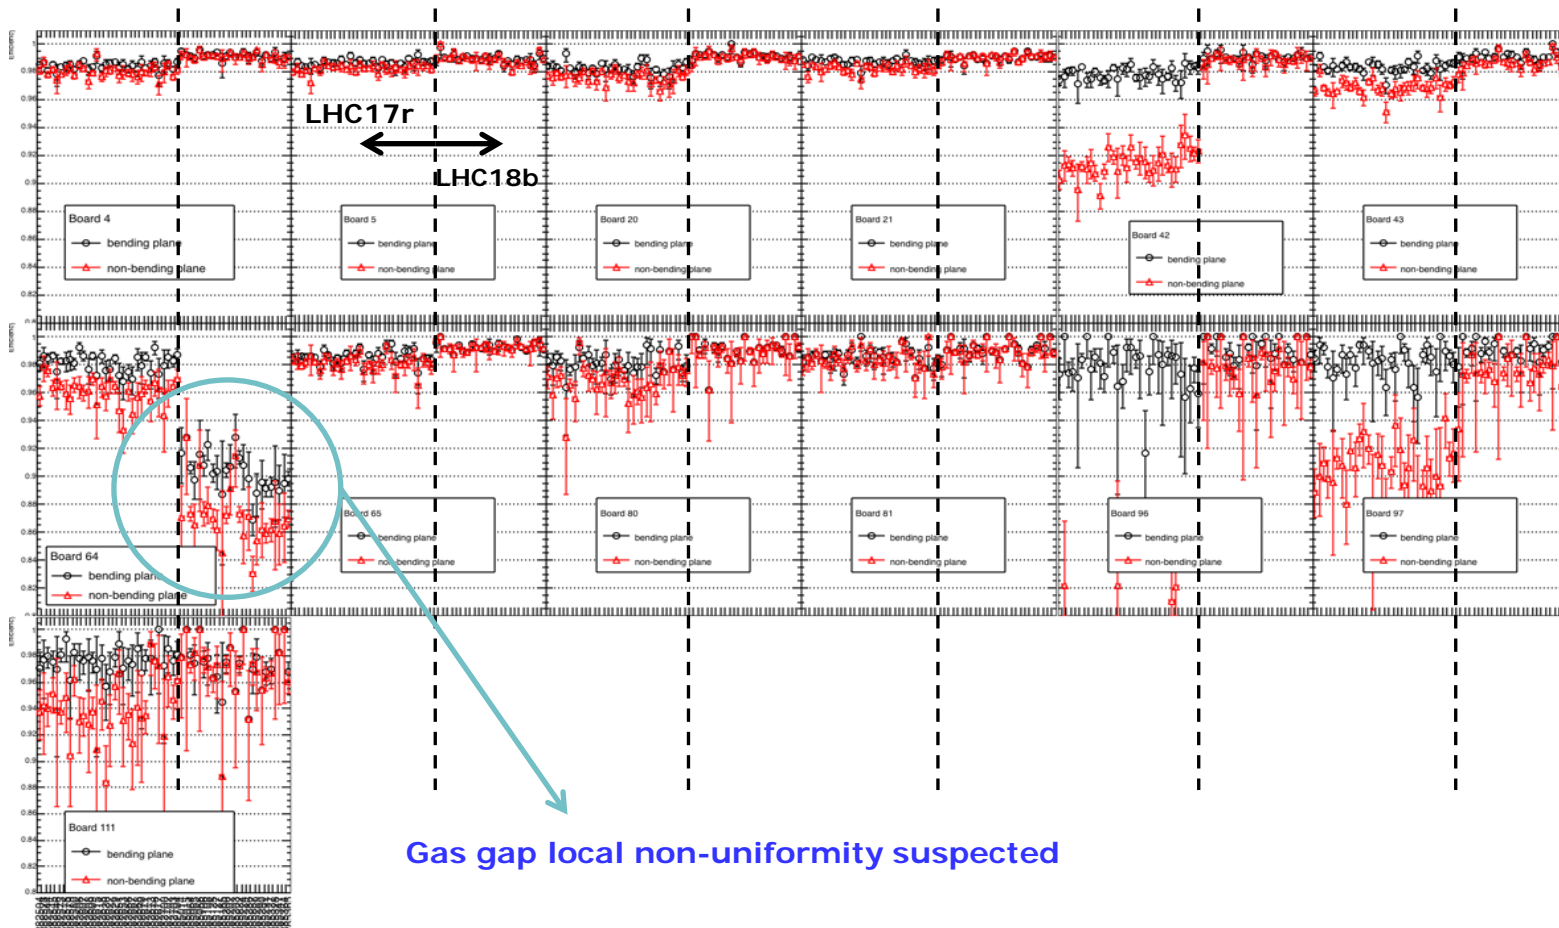

□ ***Average RPC current during high luminosity test (june 2018)***

- RPC HV run-3 equivalent (with FEERIC)
- No trip, no spike, I_{RPC} linear vs. luminosity up to 50 kHz Pb-Pb equivalent

Equivalent to Pb-Pb 50 kHz

- *Comparison of MT22-IN3 efficiency between LHC17r and LHC18b periods in standard conditions of operation (all RPC area)*
 - High efficiency reached with RPC from new production (LHC18b)

MID : FEERIC wireless threshold distribution

- ❑ **Why going to new -wireless- threshold distribution ?**
 - **Threshold setting per FEERIC card** (vs. per RPC side in the present setup)
 - Possibility of fine tuning locally each RPC working point (common HV, threshold optimization)
- ❑ **Technical choices** (discussed at Dec. 2017 ALICE TB)
 - Zigbee high level protocol used (for wireless transmission)
 - SoftWare based on Arduino libs (I2C, SD and Xbee cards)
 - I2C bus between FEERIC cards on each RPC side
- ❑ **Status**
 - Wireless threshold Hw/Sw prototype installed in Feb. 2018 on the RPC equipped with FEERIC cards in ALICE cavern
 - Long term performance and reliability tests in 2018
 - **R&D ongoing for ethernet link to Xbee master**

- ❑ **Small production**
 - 24 Xbee peripheral cards
 - 2 master cards
- ❑ **Production, installation**
 - end 2018, early 2019

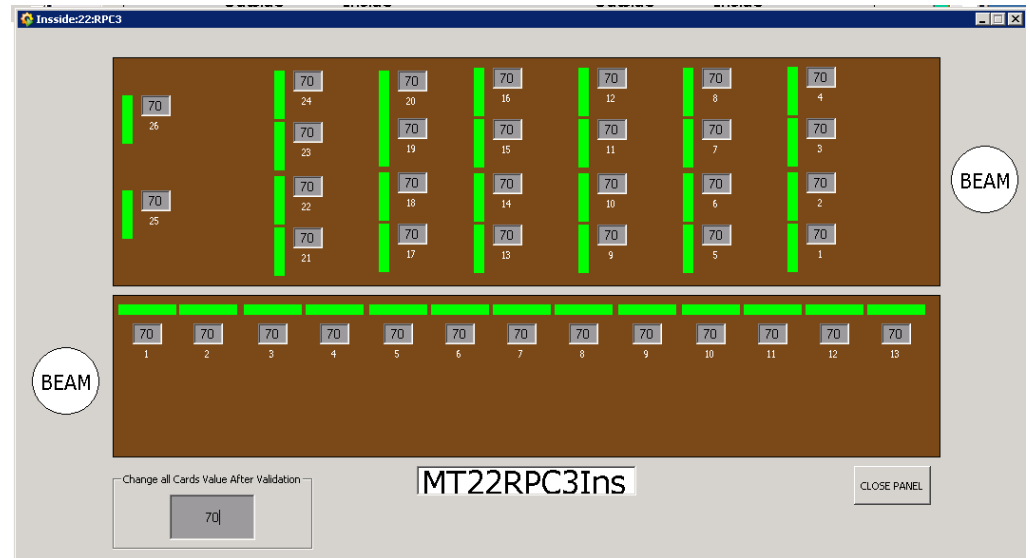

❑ *Xbee card description and functionalities*

- Same Xbee card for master and peripheral cards (1->12 in ALICE)
- One single FirmWare: master/peripheral role is assigned by SoftWare configuration. By default, a board acts as peripheral
- SD Card for initialisation
- EEPROM for storing/re-loading last used threshold values in case of power cycle
- Whole chain, hw+sw, operational, including PVSS software

Xbee peripheral coupled to FEERIC board (threshold setting via I2C)

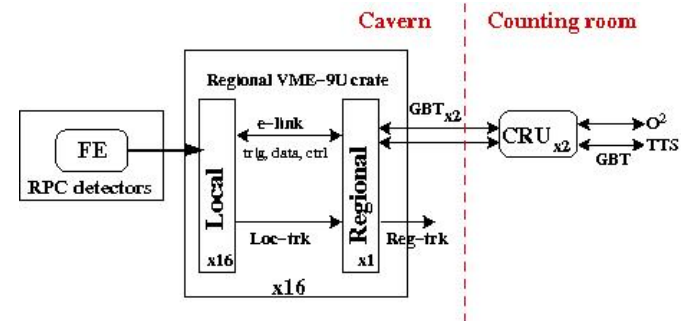

MID : Readout Electronics Prototype

- ❑ *Readout electronics for continuous mode*
- ❑ *Replacement of the 234 Local and of the 16 Regional cards presently in operation*
- ❑ *Readout card **prototype** ready since early 2016 (EDR in June 2015) and fully operational*

- Emulate, on the same card, 7 Local cards connected by e-links@320 Mb/s to one Regional card implementing one GBT@3.2 Gb/s (GBTx, GBT-SCA, VTRx)
- FPGA programming and GBT config. OK
- Tests of communication with G-RORC (as CRU emulator) validated in Jan. 2017
- Slow control I2C (via GBT-SCA) OK
- Advanced FPGA firmware ready
- Response to HB triggers OK
- Self-triggered events OK

- ❑ **Pre-series** : 3 samples of Local, Regional and J2-bus (between Loc-Reg) produced => **full chain tests**
- ❑ **PRR defended in April 2018** (<https://indico.cern.ch/event/719264/>)
 - Tests (signal transmission integrity mostly) and Local & Regional card layout to be finalized
 - Full crate (1/16 of total) still to be validated
 - **PRR follow-up meeting before production**

❑ Eye diagrams : triggers and clock (downlink)

Keysight Infiniium : Thursday, June 07, 2018 3:07:17 PM

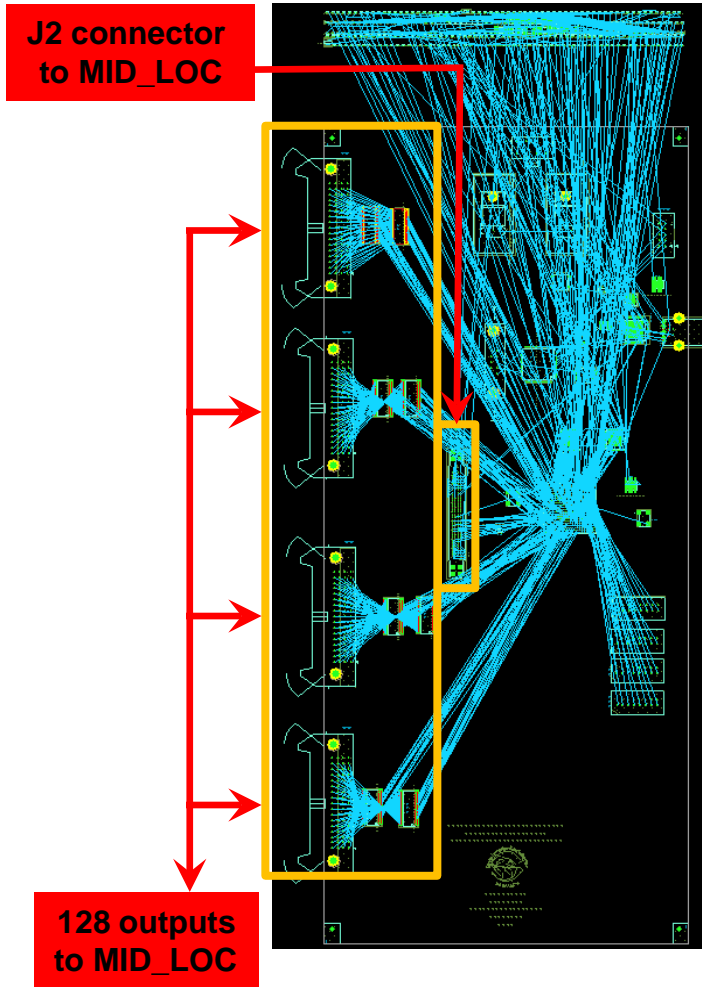

❑ MID-TST-LOC

- Layout completed in Subatech
- Routing, production ongoing at LPC

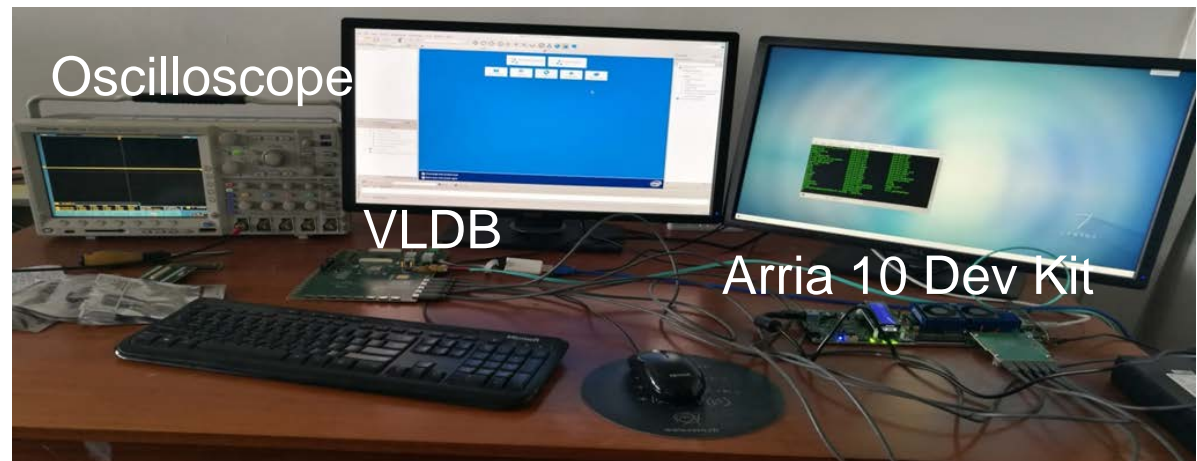

❑ MID-FE-LOC-INTERFACE

- Support for 8 FEERIC cards
- Delivered by LPC to Subatech

- ❑ ***ALICE team of South Africa has joined MID project in 2017***
 - In charge of MID CRU specific code development
 - Will be involved in full crate validation
 - A test bench has been set up (waiting for LTU, CRU+FLP for completion)
 - Output data format is discussed regularly with O2 experts
 - Input raw data format and segmentation was provided to SA team by MID readout electronics developer

- ❑ ***First release of MID user logics (up-link only) ongoing***

- ❑ ***MID CRUs***
 - 2 CRUs of type "24/24" in the counting room
 - 1 CRU+FLP from first batch in Subatech for tests of readout electronics (July 2018)
 - 1 CRU+FLP req. asap in SA for MID user logics

V2.5 (Jan-18)	2015	2016	2017	2018	2019	2020
