- Lepton Flavour Universality
- Semitauonic decays:  $R(D^{*-})$

- Fit results

**Introduction**

**Method**

**Results**

**Conclusions**

- Features of the analysis
- Analysis method

- Global picture
- Conclusions

# Lepton Flavour Universality

- SM predicts **Lepton Flavour Universality (LFU)**: equal couplings between gauge bosons and the three lepton families
- Tensions between SM expectation and experimental results:
  - Charged currents:  $b \rightarrow cl\nu$  : this talk ☺
  - Neutral currents:  $b \rightarrow sll$  transitions
- Observation of violation of LFU: sign of **new physics**
- A large class of BSM models contain new interactions that involve third generations of quarks and leptons:
  - Charged Higgs, leptoquarks,  $W'$  ...

# Why semitauonic decays?

**Tree level decays** in the SM, mediated by a W boson

$$R(\mathcal{H}_c) = \frac{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \tau \nu_\tau)}{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \mu \nu_\mu)}$$

$$\mathcal{H}_b = B^0, B_{(c)}^+, \Lambda_b^0 \dots$$

$$\mathcal{H}_c = D^*, D^0, D^+, D_s, \Lambda_c^{(*)}, J/\psi \dots$$

- **Clean prediction from SM**
  - Partial cancelation of form factors uncertainties in the ratio
  - Deviation from unity due to different available phase space
- **Large rate** of charged current decays  $\text{BR}(B \rightarrow D^* \tau \nu) \sim 1.2\%$  in SM
- **Sensitivity to NP** contributions at tree level

# Why semitauonic decays?

Tree level decays in the SM, mediated by a W boson

$$R(\mathcal{H}_c) = \frac{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \tau \nu_\tau)}{\mathcal{B}(\mathcal{H}_b \rightarrow \mathcal{H}_c \mu \nu_\mu)}$$

$$\mathcal{H}_b = B^0, B_{(c)}^+, \Lambda_b^0 \dots$$

$$\mathcal{H}_c = D^*, D^0, D^+, D_s, \Lambda_c^{(*)}, J/\psi \dots$$

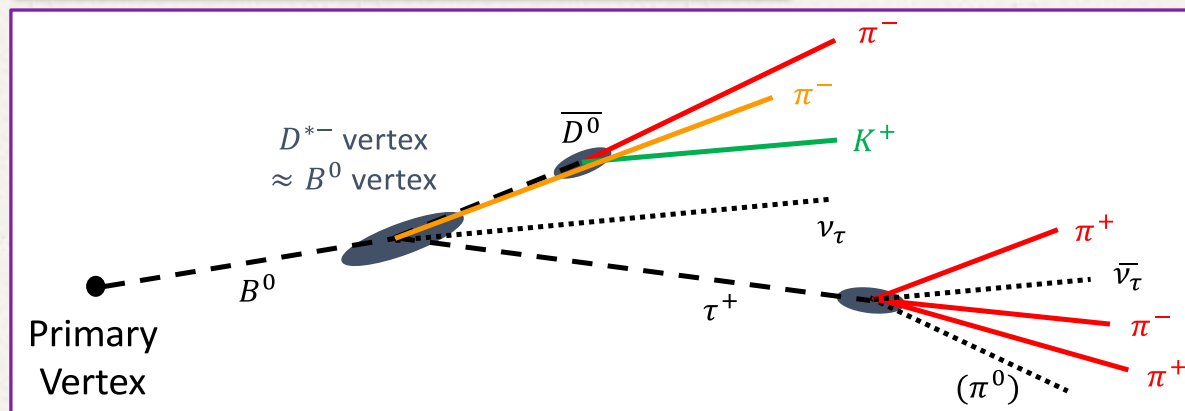

- **Clean prediction from SM**
  - Partial cancelation of form factors uncertainties in the ratio
  - Deviation from unity due to different available phase space
- **Large rate** of charged current decays  $\text{BR}(B \rightarrow D^* \tau \nu) \sim 1.2\%$  in SM
- **Sensitivity to NP** contributions at tree level

## In this talk... $R(D^{*-})$

$$R(D^{*-}) = \frac{\mathcal{B}(B^0 \rightarrow D^{*-} \tau^+ \nu_\tau)}{\mathcal{B}(B^0 \rightarrow D^{*-} \mu^+ \nu_\mu)}$$

[PhysRevD.97.072013]  
[PhysRevLett.120.171802]

- $\tau$  lepton reconstructed using the  $\tau^+ \rightarrow \pi^+ \pi^- \pi^+ (\pi^0) \nu_\tau$  decay mode
- Semileptonic decay without charged leptons in final state

# Features of the analysis

- **Testing LFU with  $R(D^{*-})$ .** What we measure:

$$R_{had}(D^{*-}) = \frac{\mathcal{B}(B^0 \rightarrow D^{*-} \tau^+ \nu_\mu)}{\mathcal{B}(B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+)} = \frac{N_{sig}}{N_{norm}} \times \frac{\epsilon_{norm}}{\epsilon_{sig}} \times \frac{1}{\mathcal{B}(\tau^+ \rightarrow \pi^+ \pi^- \pi^+ (\pi^0) \bar{\nu}_\tau)}$$

- Signal and normalization share same visible state:  $D^{*-} \pi^+ \pi^- \pi^+$
- Most of the theoretical and experimental uncertainties on luminosity, cross sections and hadronization probability cancel out in the ratio

- **$R(D^{*-})$  obtained from:**

$$R(D^{*-}) = R_{had}(D^{*-}) \times \frac{\mathcal{B}(B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+)}{\mathcal{B}(B^0 \rightarrow D^{*-} \mu^+ \nu_\mu)}$$

[4.0 % precision, PDG2017]  
[2.2 % precision, HFLAV 2016]

# R( $D^{*-}$ ) hadronic: strategy

- Most important background due to  $B \rightarrow D^{*+} \pi^+ \pi^- \pi^+ X$  (neutrals), where 3 pions come from the  $B$  vertex (100 higher than the signal)
- Requirement: decay topology with minimum distance between  $B$  and  $\tau$  vertices  $> 4 \sigma_{\Delta z}$ . Suppressed by 3 orders of magnitude
- 2nd most important background comes from  $B \rightarrow D^{*+} D_s^+ X$ . Multivariate Analysis

# R(D<sup>\*-</sup>) fit results

## Result run 1 data:

- $N(B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+)$  unbinned likelihood fit to  $M(D^{*-} \pi^+ \pi^- \pi^+)$
- $N(B^0 \rightarrow D^{*-} \tau^+ \nu_\tau)$  three dimensional binned fit to data

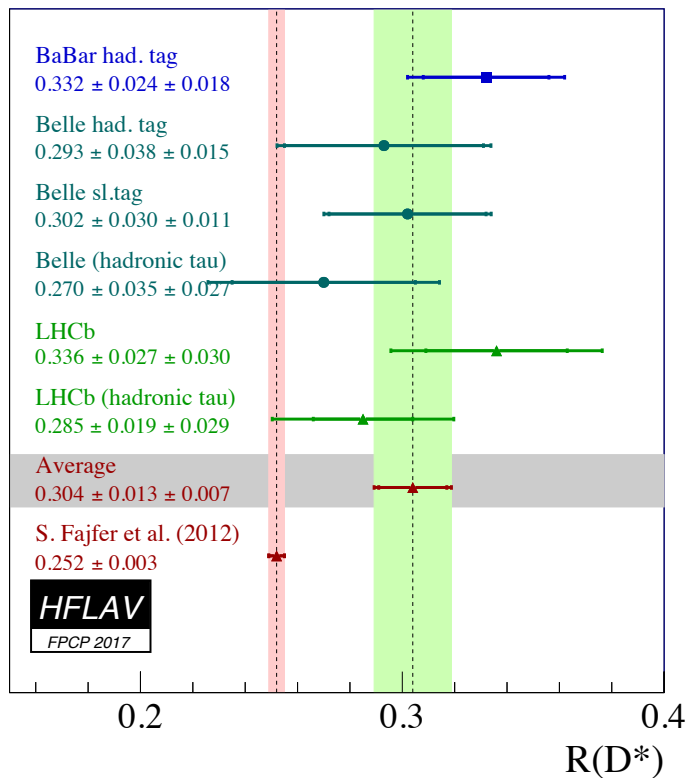

Variables:  $\tau$  decay time,  $q^2$ , BDT output

$$R(D^{*-}) = 0.291 \pm 0.019(\text{stat}) \pm 0.026(\text{syst}) \pm 0.013(\text{ext})$$

# Conclusions & future prospects

## LFUV new road to NP!

[HFLAV]

**WA combination of  $R(D^*)/R(D)$  in tension with SM at the  $4.1 \sigma$  level**

Exciting program ahead! Updates and new analysis with run 2 data,  $5 \text{ fb}^{-1}$   
Statistical and systematic uncertainties will be reduced.

- $R(D^*), R(D^0), R(D^+), R(D_s), R(J/\psi), R(\Lambda_c)...$

**STAY TUNED!**

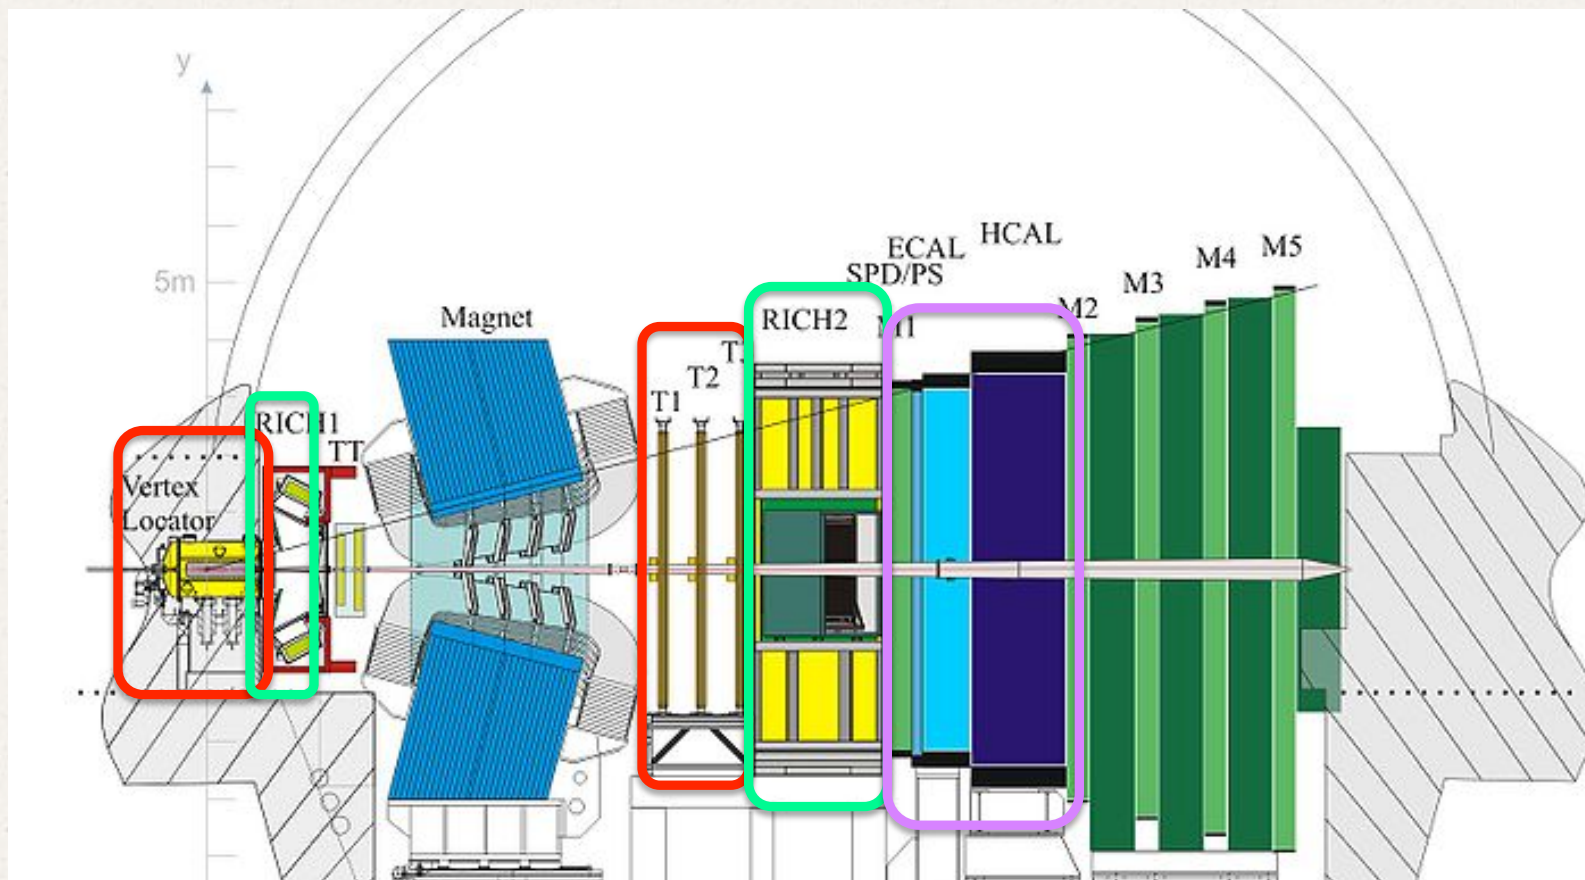

Thank you for your attention

---

*Any question?*

# Backup slides

---

- Excellent **vertex resolution**:  $20\mu\text{m}$  resolution on impact parameter
- Excellent **particle identification**
- **Calorimeter systems**: suppress events with missing neutral energy ( $\pi^0$ ,  $K^0$ ,  $\Upsilon$ )

# BDT

- Most important background after the inversion cut comes from  $B \rightarrow D^* D_s^+ X$
- Multivariate Analysis: 18 variables combined in a **BDT**:
  - 3  $\pi$  variables
  - $D^* 3\pi$  dynamics
  - Neutral isolation variables

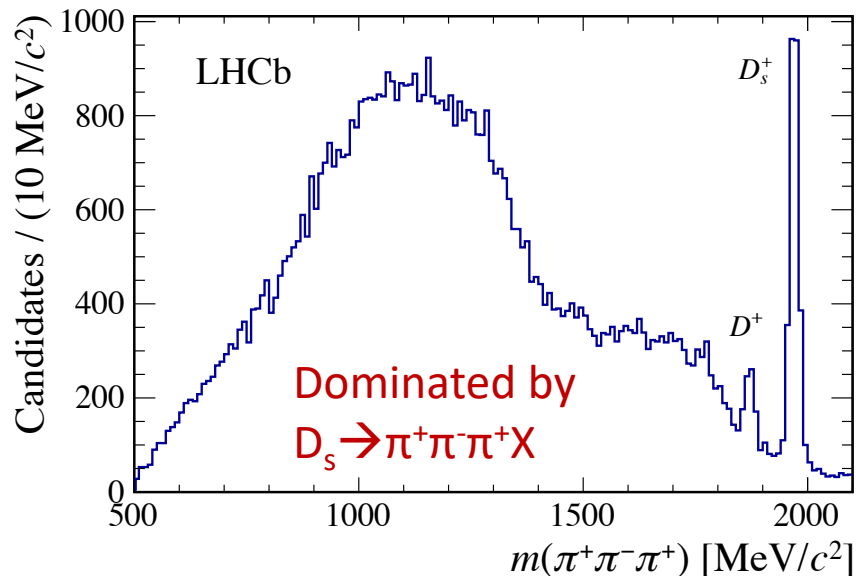

BDT used as variable in the fit to extract signal yield

# R( $D^{*-}$ ) systematics

Main systematic uncertainties due to:

- Size of **simulated sample**
- Shape of the **background**  $B \rightarrow D^{*-} D_s^+ X$
- $D_{(s)}^+ \rightarrow \pi^+ \pi^- \pi^+ X$  decay mode. **BESII** future measurement will reduce this uncertainty. Improvement as well of the upgraded ECAL
- Branching fraction of normalisation mode  $B^0 \rightarrow D^{*-} \pi^+ \pi^- \pi^+$  known with  $\sim 4\%$  precision. **Belle II** can measure it precisely

# R( $D^{*-}$ ) systematics

Contribution	Value in %
$\mathcal{B}(\tau^+ \rightarrow 3\pi\bar{\nu}_\tau)/\mathcal{B}(\tau^+ \rightarrow 3\pi(\pi^0)\bar{\nu}_\tau)$	0.7
Form factors (template shapes)	0.7
$\tau$ polarization effects	0.4
Other $\tau$ decays	1.0
$B \rightarrow D^{**}\tau^+\nu_\tau$	2.3
$B_s^0 \rightarrow D_s^{**}\tau^+\nu_\tau$ feed-down	1.5
$D_s^+ \rightarrow 3\pi X$ decay model	2.5
$D_s^+$ , $D^0$ and $D^+$ template shape	2.9
$B \rightarrow D^{*-}D_s^+(X)$ and $B \rightarrow D^{*-}D^0(X)$ decay model	2.6
$D^{*-}3\pi X$ from $B$ decays	2.8
Combinatorial background (shape + normalization)	0.7
Bias due to empty bins in templates	1.3
Size of simulation samples	4.1
Trigger acceptance	1.2
Trigger efficiency	1.0
Online selection	2.0
Offline selection	2.0
Charged-isolation algorithm	1.0
Normalization channel	1.0
Particle identification	1.3
Signal efficiencies (size of simulation samples)	1.7
Normalization channel efficiency (size of simulation samples)	1.6
Normalization channel efficiency (modeling of $B^0 \rightarrow D^{*-}3\pi$ )	2.0
Form factors (efficiency)	1.0
Total uncertainty	9.1
