

Numerical calculation of high-order QED contributions to the electron anomalous magnetic moment

Sergey Volkov

SINP MSU, Dubna branch (Russia)
DLNP JINR, Dubna (Russia)

ACAT-2019

AMM of the electron (theory and experiment)

The measured value [2011]:

$$a_e = 0.00115965218073(28)$$

The most accurate prediction (T. Kinoshita et al. [2019]):

$$a_e = a_e(QED) + a_e(\text{hadronic}) + a_e(\text{electroweak}),$$

$$a_e(QED) = \sum_{n \geq 1} \left(\frac{\alpha}{\pi} \right)^n a_e^{2n},$$

$$a_e^{2n} = A_1^{(2n)} + A_2^{(2n)}(m_e / m_\mu) + A_2^{(2n)}(m_e / m_\tau) + A_3^{(2n)}(m_e / m_\mu, m_e / m_\tau)$$

$$a_e = 0.001159652181606(11)(12)(229)$$

($\alpha^{-1} = 137.035999046(27)$ – independent from a_e)

Uncertainties come from:

$$A_1^{(10)}, a_e(\text{hadronic}) + a_e(\text{electroweak}), \alpha$$

T. Aoyama, T. Kinoshita, M. Nio, Theory of the Anomalous Magnetic Moment of the Electron, Atoms 2019, 7(1), 28.

$A_1^{(2n)}$ calculations are still important...

Universal QED contributions

$$a_e = a_e(QED) + a_e(\text{hadronic}) + a_e(\text{electroweak}),$$

$$a_e(QED) = \sum_{n \geq 1} \left(\frac{\alpha}{\pi} \right)^n a_e^{2n},$$

$$a_e^{2n} = A_1^{(2n)} + A_2^{(2n)}(m_e/m_\mu) + A_2^{(2n)}(m_e/m_\tau) + A_3^{(2n)}(m_e/m_\mu, m_e/m_\tau)$$

- J. Schwinger [1948], analytically: $A_1^{(2)} = 0.5$
- R. Karplus, N. Kroll [1949] – with a mistake
A. Petermann [1957], C. Sommerfield [1958], analytically:
$$A_1^{(4)} = -0.328478966\dots$$
- ~1970...~1975, 3 loops, numerically:
 1. M. Levine, J. Wright.
 2. R. Carroll, Y. Yao.
 3. T. Kinoshita, P. Cvitanović.
T. Kinoshita, P. Cvitanović [1974]: $A_1^{(6)} = 1.195 \pm 0.026$
- E. Remiddi, S. Laporta et al., ~1965...1996, analytically: $A_1^{(6)} = 1.181241456\dots$
- T. Kinoshita, M. Nio et al., numerically, 2015: $A_1^{(8)} = -1.91298(84)$
- S. Laporta, semi-analytically, 2017: $A_1^{(8)} = -1.9122457649\dots$
- T. Kinoshita, M. Nio et al., numerically, 2019: $A_1^{(10)} = 6.737(159)$

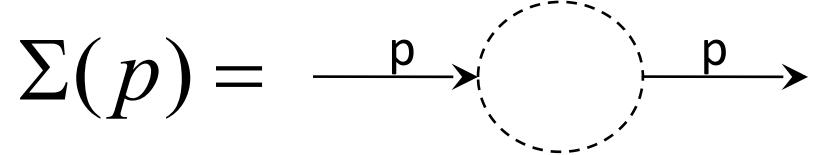

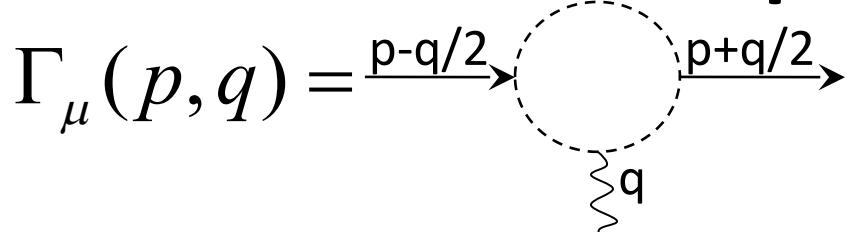

The method

- Subtraction procedure for removing both IR and UV divergences in Feynman-parametric space for each individual Feynman diagram
- Diagram-specific importance sampling Monte Carlo integration algorithm for diagrams without lepton loops

The subtraction procedure

- FULLY AUTOMATED AT ANY ORDER OF THE PERTURBATION SERIES.
- UV and IR divergences are eliminated point-by-point in Feynman-parametric space for each individual Feynman diagram. No regularization is required.
- Subtraction by a forest formula with linear operators.
Each operator transforms Feynman amplitude of some UV-divergent subdiagram G' (in momentum space) to the polynom with the degree that is less or equal to $\omega(G')$.
- The subtraction is equivalent to the on-shell renormalization => no residual renormalizations, no calculations of renormalization constants, no other manipulations.

Operators

- A – projector of AMM

$$\bar{u}_2 \Gamma_\mu(p, q) u_1 = \bar{u}_2 (f(q^2) \gamma_\mu - g(q^2) \sigma_{\mu\nu} q^\nu / (2m) + h(q^2) q_\mu) u_1$$

$$\sigma_{\mu\nu} = (\gamma_\mu \gamma_\nu - \gamma_\nu \gamma_\mu) / 2, \quad (p - q/2)^2 = (p + q/2)^2 = m^2$$

$$(\hat{p} - \hat{q}/2 - m) u_1 = (\hat{p} + \hat{q}/2 - m) u_2 = 0$$

$$A \Gamma_\mu = \gamma_\mu \lim_{q^2 \rightarrow 0} g(q^2)$$

- L – on-shell renormalization for vertex-like subdiagrams

$$L \Gamma_\mu = \gamma_\mu (a(m^2) + b(m^2)m + c(m^2)m^2)$$

can produce additional IR divergences

- U – intermediate operator

$$\Gamma_\mu(p, 0) = a(p^2) \gamma_\mu + b(p^2) p_\mu + c(p^2) \hat{p} p_\mu + d(p^2) (\hat{p} \gamma_\mu - \gamma_\mu \hat{p}) \quad \Sigma(p) = r(p^2) + s(p^2) \hat{p}$$

$$U \Gamma_\mu = \gamma_\mu a(m^2)$$

$$U \Sigma = r(m^2) + s(m^2) \hat{p}$$

IR-safe! U preserves the Ward identity!

For the other types of divergent subgraphs, U=Taylor expansion at 0 up to ω order.

Forest formula for AMM

A set of subgraphs of a diagram is called a **forest** if any two elements of this set don't overlap.

$F[G]$ – the set of all forests of UV-divergent subgraphs in G that contain G .

$I[G]$ – the set of all vertex-like UV-divergent subgraphs in G that contains the vertex that is incident to the external photon line of G .

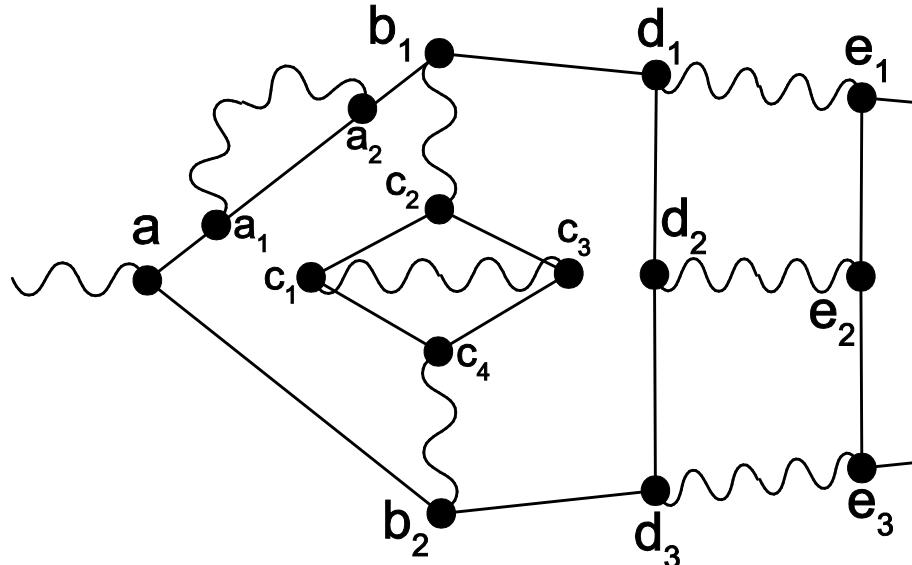

$$\tilde{f}_G = \sum_{\substack{F = \{G_1, \dots, G_n\} \in F[G] \\ G' \in I[G] \cap F}} (-1)^{n-1} K_{G_1}^{G'} \dots K_{G_n}^{G'} f_G$$

$$K_{G''}^{G'} = \begin{cases} A_{G'} & \text{for } G' = G'' \\ U_{G''} & \text{for } G'' \notin I[G], \text{ or } G'' \subseteq G' \text{ and } G'' \neq G' \\ L_{G''} & \text{for } G'' \in I[G], G' \subseteq G'', G'' \neq G, G'' \neq G' \\ (L_{G''} - U_{G''}) & \text{for } G'' = G, G' \neq G \end{cases}$$

$$\bar{f}_G = \text{coefficient before } \gamma_\mu \text{ in } \tilde{f}_G$$

$$a_e = \sum_G \bar{f}_G$$

Example

$$G_c = aa_1 a_2 b_1 b_2 c_1 c_2 c_3 c_4$$

$$G_e = aa_1 a_2 b_1 b_2 c_1 c_2 c_3 c_4 d_1 d_2 d_3 e_1 e_2 e_3$$

$$I[G] = \{G_c, G_e, G\}$$

Other UV-divergent subgraphs:

electron self-energy – $a_1 a_2$, vertex-like – $c_1 c_2 c_3$, $c_1 c_3 c_4$,

photon self-energy – $c_1 c_2 c_3 c_4$,

photon-photon scattering – $G_d = aa_1 a_2 b_1 b_2 c_1 c_2 c_3 c_4 d_1 d_2 d_3$

$$\begin{aligned} \tilde{f}_G = & \left[A_G (1 - U_{G_e}) (1 - U_{G_c}) - (L_G - U_G) A_{G_e} (1 - U_{G_c}) - (L_G - U_G) (1 - L_{G_e}) A_{G_c} \right] \cdot \\ & \cdot (1 - U_{G_d}) (1 - U_{c_1 c_2 c_3 c_4}) (1 - U_{c_1 c_2 c_3} - U_{c_1 c_3 c_4}) (1 - U_{a_1 a_2}) f_G \end{aligned}$$

Importance sampling Monte Carlo

- Integral: $\int_{\Omega} f(x)dx$
- Probability density function: $g(x)$
- Approximation: $(1/N)\sum_{1 \leq j \leq N}(f(x_j)/g(x_j))$
- Variance: $V(f,g) = \int_{\Omega}(f(x)^2/g(x))dx - (\int_{\Omega}f(x)dx)^2$
- Error estimation: $\sigma^2 \approx V(f,g)/N$
- The goal is to minimize $V(f,g)$ by choosing $g(x)$.

NON-ADAPTIVE MONTE CARLO WORKS FINE
FOR HIGH-ORDER CALCULATIONS IN QFT!!!

Diagram-specific probability density functions

- **Integral:** $\int_{z_1, \dots, z_M > 0} f(z_1, \dots, z_M) \delta(z_1 + \dots + z_M - 1) dz$
- **Hepp sectors:** $z_{j_1} \geq z_{j_2} \geq \dots \geq z_{j_M}$
- **Density:** $C \cdot \frac{\prod_{l=2}^M (z_{j_l} / z_{j_{l-1}})^{Deg(\{j_l, j_{l+1}, \dots, j_M\})}}{z_1 \cdot z_2 \cdot \dots \cdot z_M},$

Deg is defined on subsets of {1,...,M}

(the idea of E.Speer, J. Math. Phys. 9, 1404 (1968))

- My ideas are:
 - 1) how to calculate *Deg(s)* for each set s
(taking into account the infrared behavior etc.)
 - 2) how to generate samples fastly

Obtaining $Deg(s)$

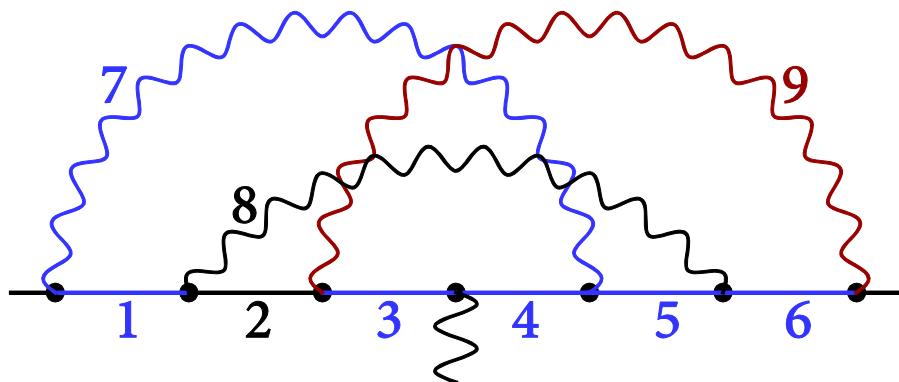

- **Sector:** $z_{j_1} \geq z_{j_2} \geq \dots \geq z_{j_M}$
 - **Density:** $C \cdot \frac{\prod_{l=2}^M (z_{j_l} / z_{j_{l-1}})^{Deg(\{j_l, j_{l+1}, \dots, j_M\})}}{z_1 \cdot z_2 \cdot \dots \cdot z_M},$
-

- The rules are constructed using ultraviolet degrees of divergence (with the sign ‘-’) of **I-closures** of sets

(the full description taking into account divergent subdiagrams is in [arXiv:1705.05800](https://arxiv.org/abs/1705.05800))

- **IClos(s)**= sUs' , where s' is the set of all photon lines for which the electron path connecting their ends is contained in s

Example: $\text{IClos}(\{1,3,4,5,6,7\}) = \{1,3,4,5,6,7,9\}$

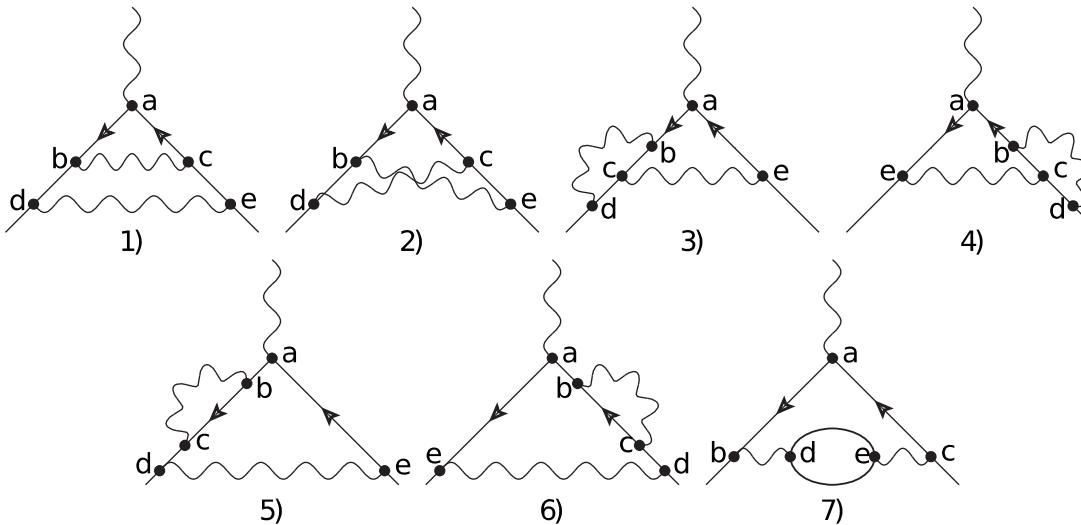

Realization and numerical results

- Monte Carlo integration on Intel-compatible CPUs, NVidia GPUs (Tesla K80, Tesla V100)
- 2 loops: all Feynman diagrams (with electron loops: old, 2015)
- 3 loops: all Feynman diagrams (with electron loops: old, 2015)
- 4 loops: diagrams without electron loops (GPU NVidia Tesla V100, supercomputer «Govorun», JINR, Dubna, Russia)
- 5 loops: diagrams without electron loops (GPU NVidia Tesla V100, supercomputer «Govorun», JINR, Dubna, Russia)
- 6 loops: ladder diagram (NVidia Tesla K80, Google Cloud)

$A_1^{(4)}$: all Feynman diagrams

NVidia Tesla K80, Google Cloud

$$2015: A_1^{(4)} = -0.328513(87)$$

$$2018: A_1^{(4)}[\text{no lepton loops}] = -0.3441651(34)$$

Analytical, 1957:

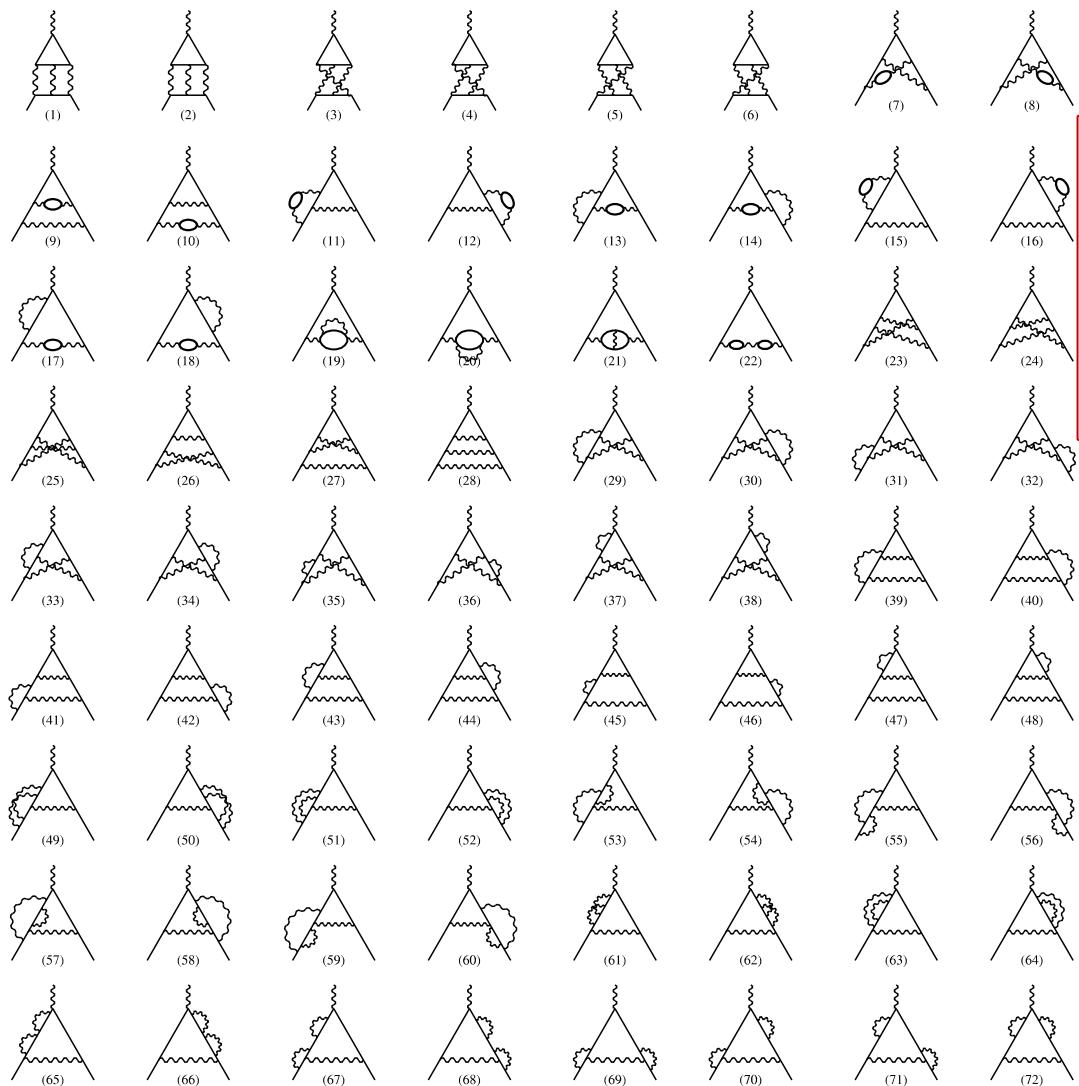

$$A_1^{(4)} = -0.328478966\dots$$

$$A_1^{(4)}[\text{no lepton loops}] = -0.3441663\dots$$

← old: 2015, personal computer

$A_1^{(8)}$: contribution of diagrams without electron loops

My result: **-2.1790(22)** 758 GPU-hours (NVidia Tesla V100, supercomputer «Govorun», JINR)

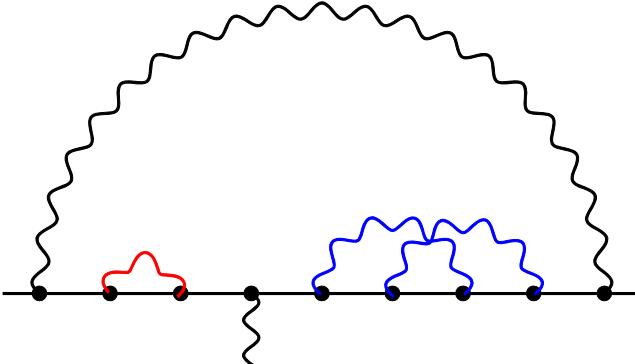

Laporta, 2017: -2.1768660277... T.Kinoshita, M.Nio et al., 2012: -2.1755(20) (not recent)

- 269 Feynman diagrams
- 10-dimensional integrals
- 78 classes of diagrams for comparison with the direct subtraction on the mass shell
- 6 gauge-invariant classes (k, m, n)

(k, m, n):

m and n photon lines to the **right** and to the **left** from the external photon (or vice versa),
 k photon lines with ends on different sides

Example of a diagram from (1,2,1):

Class	Value	Laporta, 2017
(1,3,0)	-1.96956(93)	-1.97107...
