Particle multiplicities in the central region of high-energy collisions from k_T -factorization with running coupling corrections

Horowitz and Kovchegov have derived a k_T -factorization formula for particle production at small x which includes running coupling corrections. We perform a first numerical analysis to confront the theory with data on the energy and centrality dependence of particle multiplicities at midrapidity in high-energy p+A and A+A collisions. Moreover, we point out a strikingly different dependence of the multiplicity per participant on N_{part} in p+Pb vs. Pb+Pb collisions at LHC energies, and argue that the observed behavior follows rather naturally from the convolution of the gluon distributions of an asymmetric vs. symmetric projectile and target.
