

# The Cylindrical-GEM Inner Tracker Detector of the KLOE-2 Experiment

Thursday 21 February 2019 09:00 (20 minutes)

The KLOE-2 experiment represents the continuation of KLOE and acquired  $5.5 \text{ fb}^{-1}$  data from November 2014 to March 2018 with the aim of collecting the largest sample of  $\phi$  mesons at the DAΦNE  $e^+e^-$  collider at the Frascati National Laboratory of INFN.

A new tracking device, the Inner Tracker, was installed at the interaction region of KLOE-2 and it was operated together with the Drift Chamber to improve track and vertex reconstruction capabilities of the new experimental apparatus.

The Inner Tracker is a four-layer cylindrical triple-GEM detector with each layer equipped with an X-V strips-pads stereo readout.

Although GEM detectors have been extensively used in high energy physics experiments, the IT, with its fully-cylindrical geometry, is a frontier detector and KLOE-2 is the first experiment which benefited of this novel detector technology operated at a collider.

The operation of the Inner Tracker will be presented, together with the results of the alignment and calibration and tracking-verexing performance of such a unique detector.
