

## First measurements with silicon detectors irradiated above $3 \times 10^{17}$ n/cm<sup>2</sup>

*Wednesday 6 June 2018 11:50 (20 minutes)*

Silicon detectors were recently irradiated with reactor neutrons up to fluence of  $3 \times 10^{17}$  n/cm<sup>2</sup>. The irradiated samples include detectors previously irradiated with  $1.6 \times 10^{17}$  n/cm<sup>2</sup> so these were exposed to total of  $4.6 \times 10^{17}$  n/cm<sup>2</sup>. Measurements have just started and first results will be presented in this contribution.
