Mesonic bound states in a nearly-conformal gauge theory

Thursday, 31 January 2019 10:30 (30 minutes)

The matter content of a QCD-like gauge theory is tuned such that one is close to the conformal window, but still in the confining and chiral-symmetry-breaking regime. Properties of the respective mesonic-type bound states are discussed. Preliminary results towards an investigation of the spectrum of such a theory are presented.
