Inputs to 2019/20 Strategy  
process

S. Stapnes

Papers & documents in:

<https://ilchome.web.cern.ch/content/ilc-european-strategy-document>

More about ILC:

<https://ilchome.web.cern.ch>

3 stages:

250 GeV: 20.5 km, 129 MW

500 GeV: 31.0 km, 163 MW

1 TeV: 40 km, 300 MW

# CLIC design (studied & optimized since 1985)

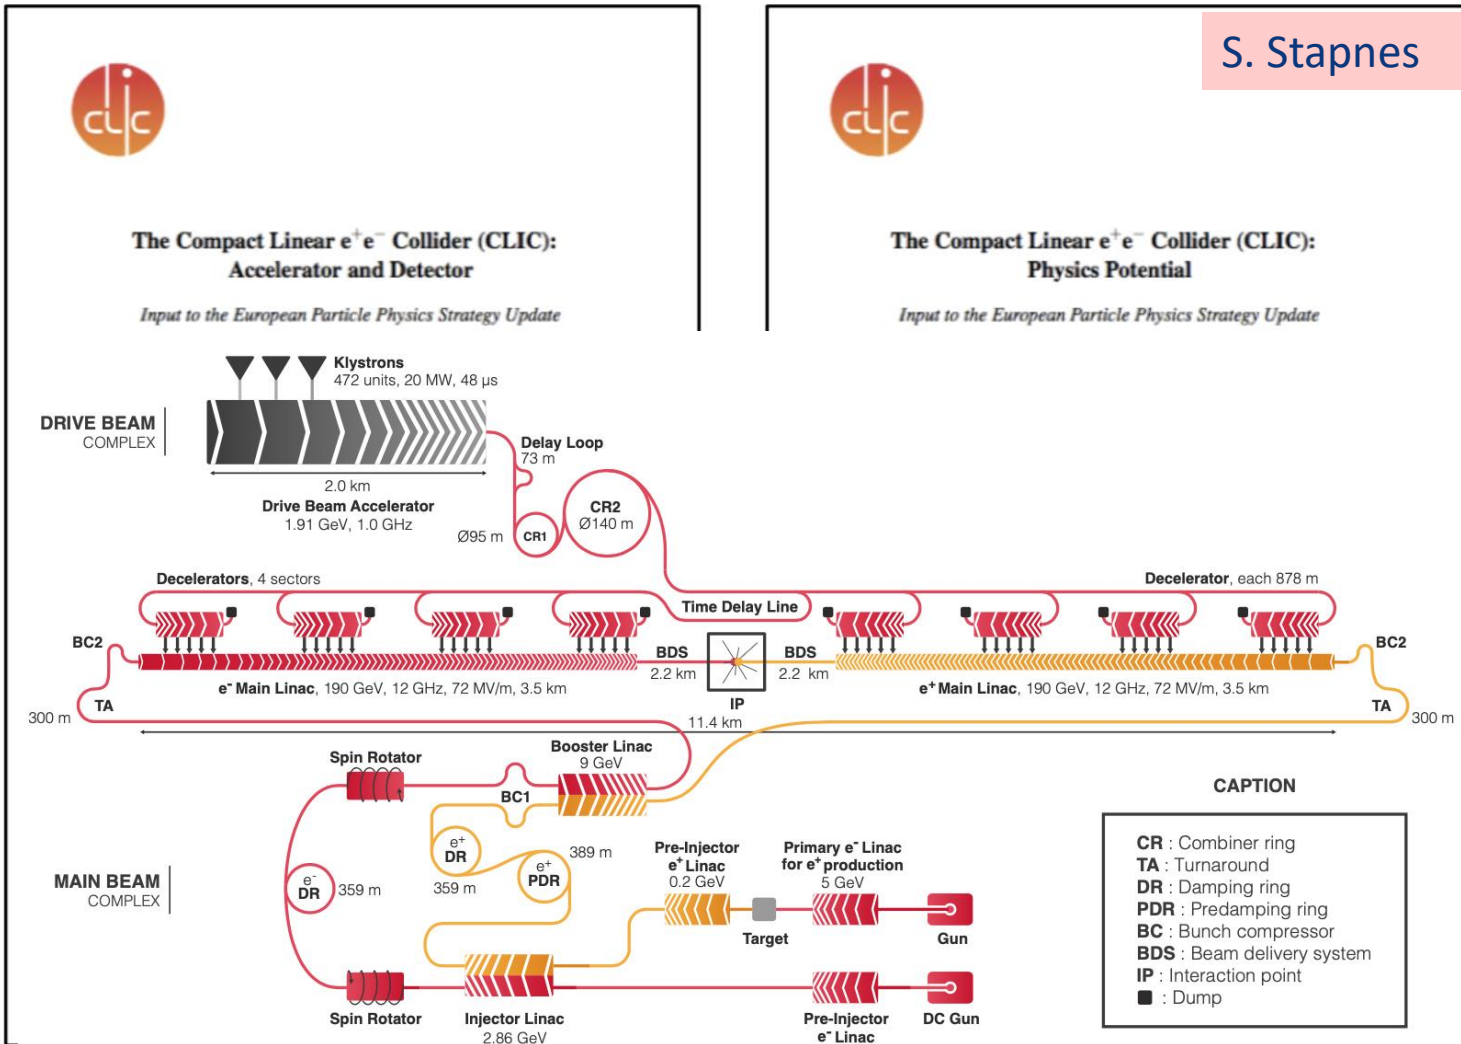

S. Stapnes

Inputs to 2019/20 Drive Beam Accelerator

These papers and supporting documents in:

<https://clic.cern/european-strategy>

More about CLIC: <https://clic.cern>

**3 stages:**

- 380 GeV: 11.4 km, 168 MW
- 1.5 TeV: 29.0 km, 364 MW
- 3 TeV: 50.1 km, 589 MW

# five major challenges driving the strategy

1. synchrotron radiation
2. bending magnetic field
3. accelerating gradient
4. (rare) particle production –  $e^+$  and  $\mu$
5. cost and sustainability

# challenge #1: synchrotron radiation (SR)

## circular colliders

energy loss per  
particle per turn

$$U_0 = \frac{e^2 \gamma^4}{3\epsilon_0 \rho}$$

SR power

$$P_{SR} = \frac{I_{beam}}{e} U_0$$

**$e^\pm$ :**  $P_{SR} = 23$  MW for LEP (former  $e^+e^-$  collider in the LHC tunnel),  
**100 MW for FCC-ee** (imposed as design constraint),

**protons:**  $P_{SR} = 0.01$  MW for LHC,  
**5 MW for FCC-hh** – this requires **>100 MW cryoplant power**

# SR in the arcs: possible mitigations (challenge #1)

## mitigations:

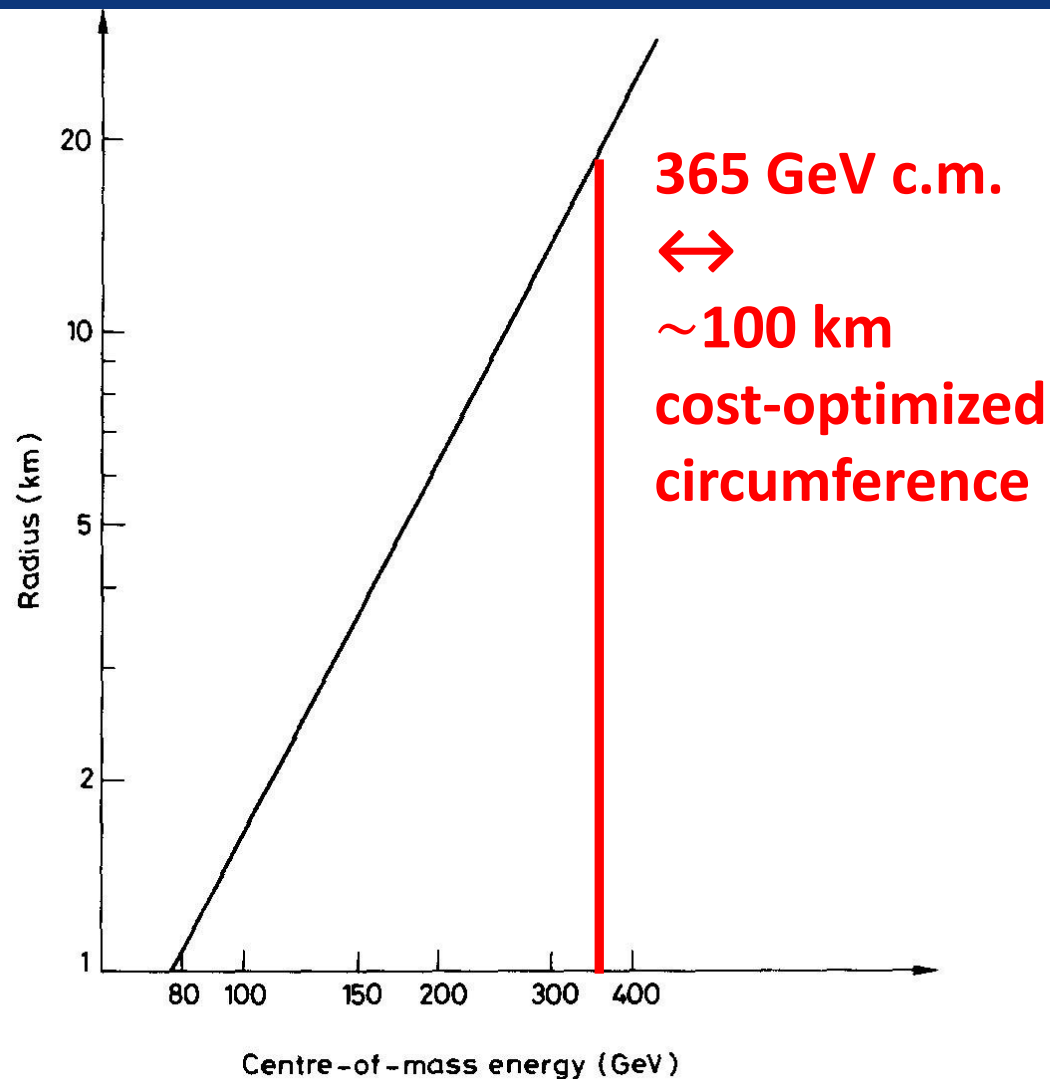

- **large bending radius  $\rho$** 
  - large circular collider → *next slide*
- **linear collider**
  - "almost" no arcs, but beamstrahlung → *next next slides*
- **muon collider**
  - $\mu$  ~200 heavier than  $e^\pm$  →  $\sim 10^9$ x less radiation at same energy and radius, but  $\mu$ 's decay → *later*
- **shaping beam vacuum chamber or the beam itself**
  - tiny vacuum chamber in large ring,  $\lambda_{sh} \approx 2\sqrt{d^3/\rho}$  with  $d$ : pipe diameter
  - beam shaping to suppress radiation; a DC beam does not radiate!
    - explored in EU projects ARIES & I.FAST → *not part of ESPPU 20*

# SR → size of circular e<sup>+</sup>e<sup>-</sup> colliders (challenge #1)

lepton ring circumference versus beam energy

Data points from S. Myers, "FCC - Building on the Shoulders of Giants", submitted to EPJ+ (2021)

B. Richter, "Very High Energy Electron-Positron Colliding Beams for the Study of Weak Interactions", NIM 136 (1976) 47-60

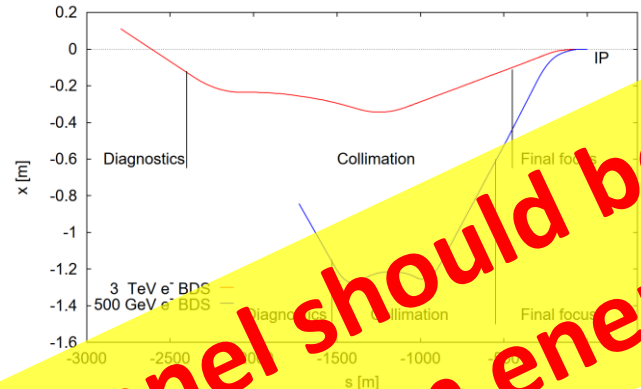

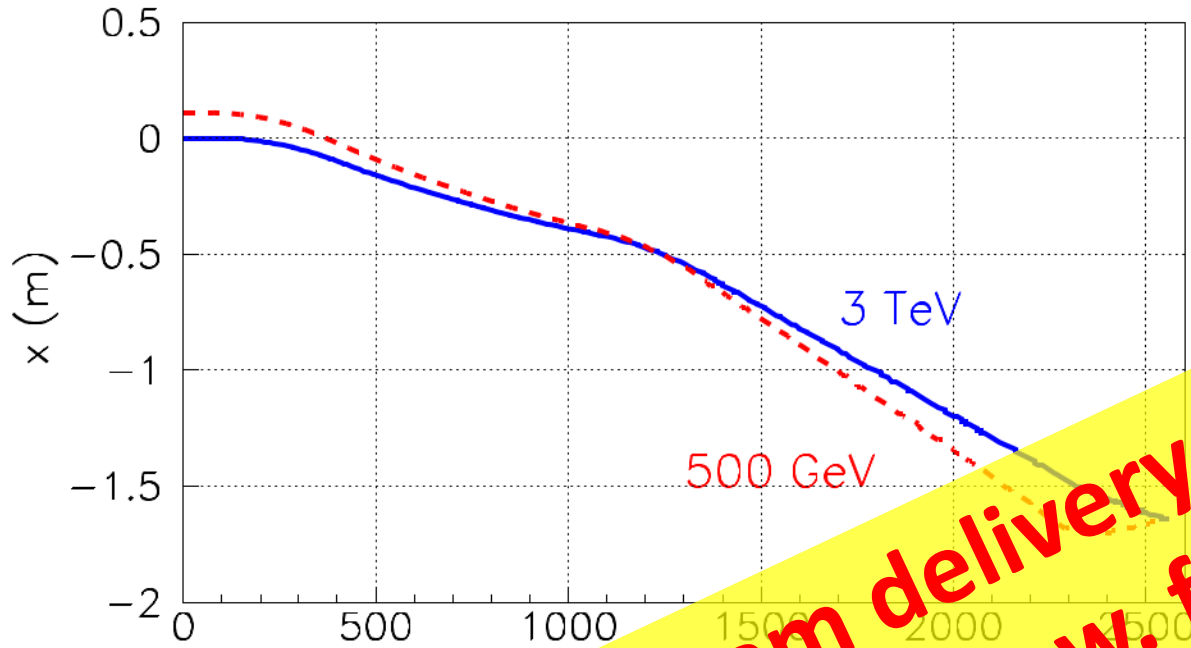

**circular colliders**

**Serendipitously, 90-100 km is exactly the size required for a 100 TeV hadron collider and optimum tunnel size in the Lake Geneva basin !**

# SR → linear collider beam delivery (challenge #1)

## linear colliders

## SR in bending magnets of the beam-delivery system

Other footprints of CLIC 3-TeV and 500-GeV beam delivery systems (G. Zanetti, R. Tomas, 2011, CLIC-Note-882)

beam delivery tunnel should be compatible w. future beam energies

SR in final quadrupole magnet (“Oide effect”) limits collision spot size  
 K. Oide, Phys. Rev. Lett. 61, 1713 (1988)

final quadrupole lens

Historical footprints of CLIC 3-TeV and 500-GeV beam delivery systems (M. Aleksa et al. 2003, CLIC-Note-551)

SR in bending magnets caused a factor ~2 loss in luminosity in 2003 CLIC BDS design at 3 TeV; similarly for the SLC at 91 GeV c.m. (!)

# challenge #1: synchrotron radiation - cont'd

linear  
colliders

synchrotron radiation in the strong field of the opposing beam (=“beamstrahlung”) degrades the luminosity spectrum

CLIC at 380 GeV: 60% of total luminosity within 1% of target energy

CLIC at 3 TeV: only 33% of total luminosity within 1% of target

$e^+e^-$  collisions in linear colliders lose their distinct energy precision

D. Schulte

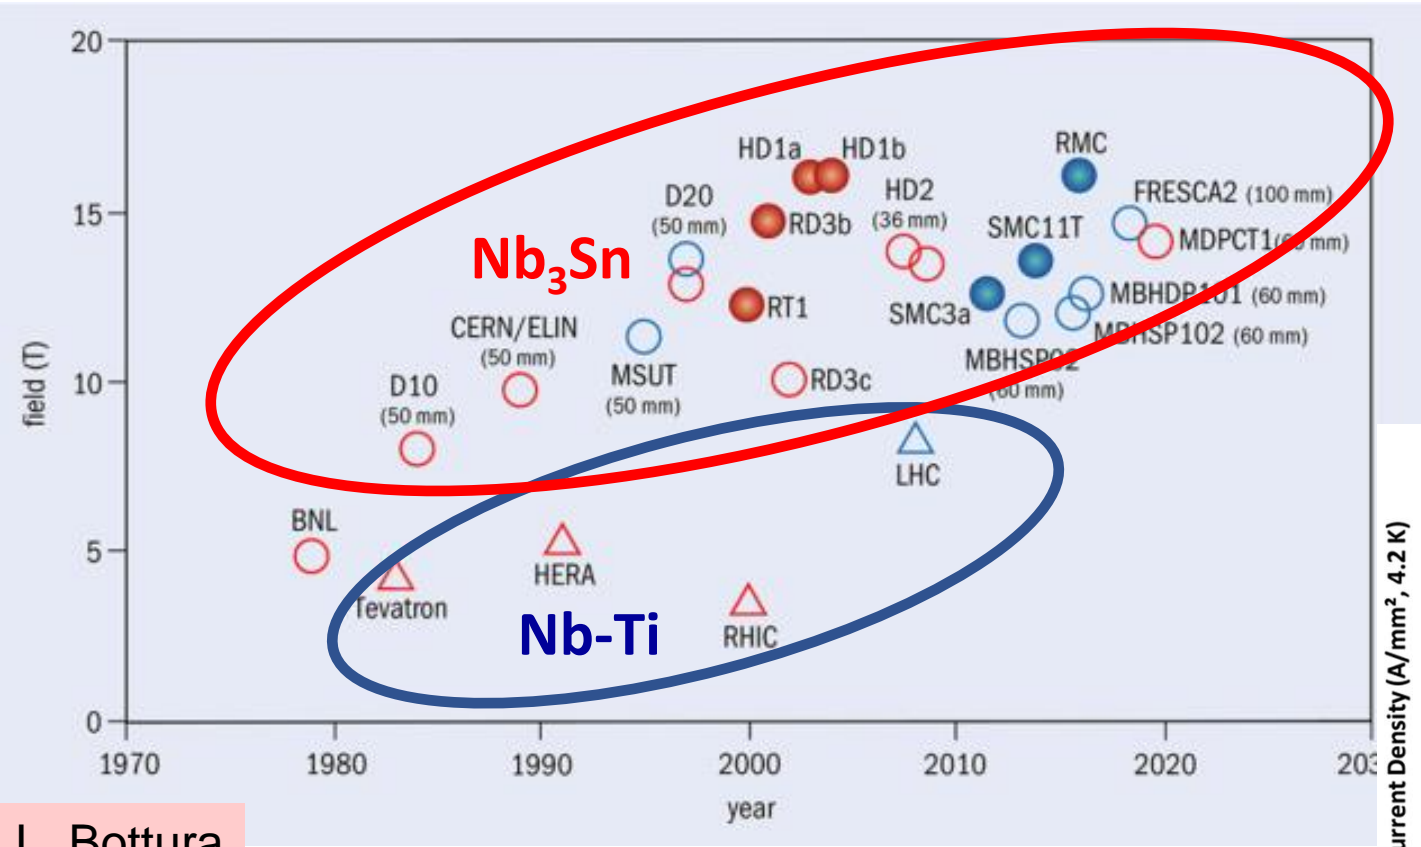

H. Abramowicz, *et al*  
- arXiv:1807.02441

# challenge #2: bending magnetic field

→ hadron collider energy reach

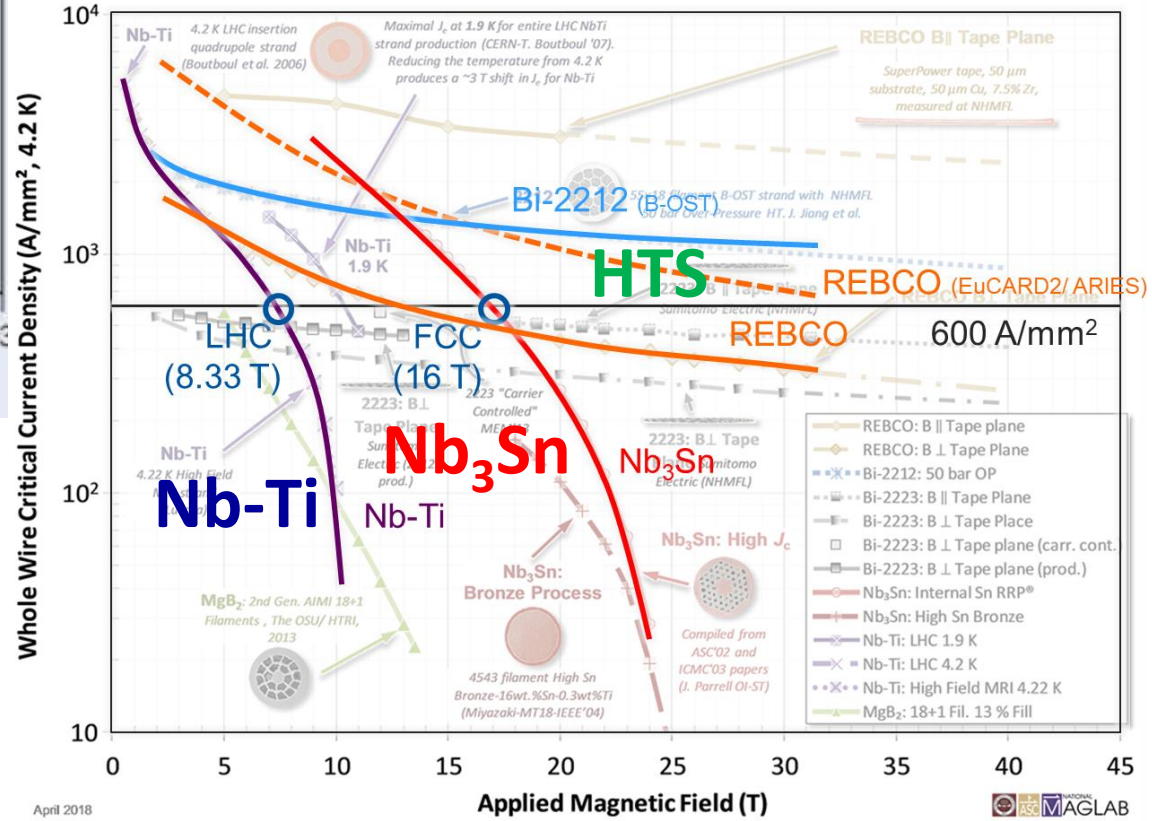

Superconducting wire critical current density versus magnetic field.

P. Lee

L. Bottura

Record fields attained with dipole magnets of various configurations and dimensions, and either at liquid (4.2 K, red) or superfluid (1.9 K, blue) helium temperature.

# challenge #3: accelerating gradient

**Gradient growth** Superconducting RF linac accelerating gradient achievements and applications since 1970. CERN Courier 2020

R. Geng

## RF Accelerators

R. Aßmann

> 30,000 operational – many serve for Health

**30 million Volt per meter**

RF: 90 years of success story for society

## Plasma Accelerators

first user facility to be realized

**100,000 million Volt per meter**

Typical RF Based Accelerator Facility to 5 GeV

**400 m**

### Added value

new RI's due to compactness and cost-efficiency bringing new capabilities to science, institutes, hospitals, universities, industry, developing countries.

Shrinking the Size of the Accelerator Facility

**60\* m**

EuPRAXIA Plasma Accelerator Facility to 5 GeV

Future

\*realistic design including all required infrastructure for powering, shielding,

# challenge #4: particle production – e<sup>+</sup>, μ

positron rates

[10<sup>10</sup>e<sup>+</sup>/s]

muon rates

[10<sup>5</sup>μ/s]

~ x100 →  
 x10,000 →

x1000 →  
 > x100,000 →

# failure of SLC e<sup>+</sup> target after 5 years of operation (challenge #4)

SLC target analysis at LANL: Failed SLC positron target was cut into pieces and metallographic studies were carried out to examine level of deterioration of material properties due to radiation exposure.

Radiation damage, work hardening, or temperature cycling?

David Schultz

Snowmass, July 10, 2001

# particle production: Gamma factory (challenge #4)

resonant scattering of laser photons off partially stripped heavy-ion beam in LHC (or FCC): high-stability laser-light-frequency converter

**Gamma Factory could provide  $e^+$  rate required for LEMMA  $\mu$  collider**

proposed applications:

- intense source of  $e^+$  ( $10^{16}$ - $10^{17}$ /s),  $\mu$  ( $10^{11}$ - $10^{12}$ /s),  $\pi$ , etc. – sufficient for LEMMA type  $\mu$  collider
- doppler laser cooling of high-energy beams
- HL-LHC w. laser-cooled isocalar ion beams

# challenge #5: cost / sustainability

P. Lebrun, RFTech 2013

Specific cost vs center-of-mass energy of CERN accelerators

*new  
concepts  
and  
new  
technologies*

cost per collision energy greatly reduced

# ESPP Update 2020 “High-priority future initiatives” - 1

- An **electron-positron Higgs factory is the highest-priority next collider**. For the longer term, the European particle physics community has the ambition to operate a **proton-proton collider at the highest achievable energy**.
- “Europe, together with its international partners, should investigate the **technical and financial feasibility of a future hadron collider at CERN with a centre-of-mass energy of at least 100 TeV** and with an **electron-positron Higgs and electroweak factory as a possible first stage**.
- Such a **feasibility study of the colliders and related infrastructure** should be established as a global endeavour and be **completed on the timescale of the next Strategy update..”**

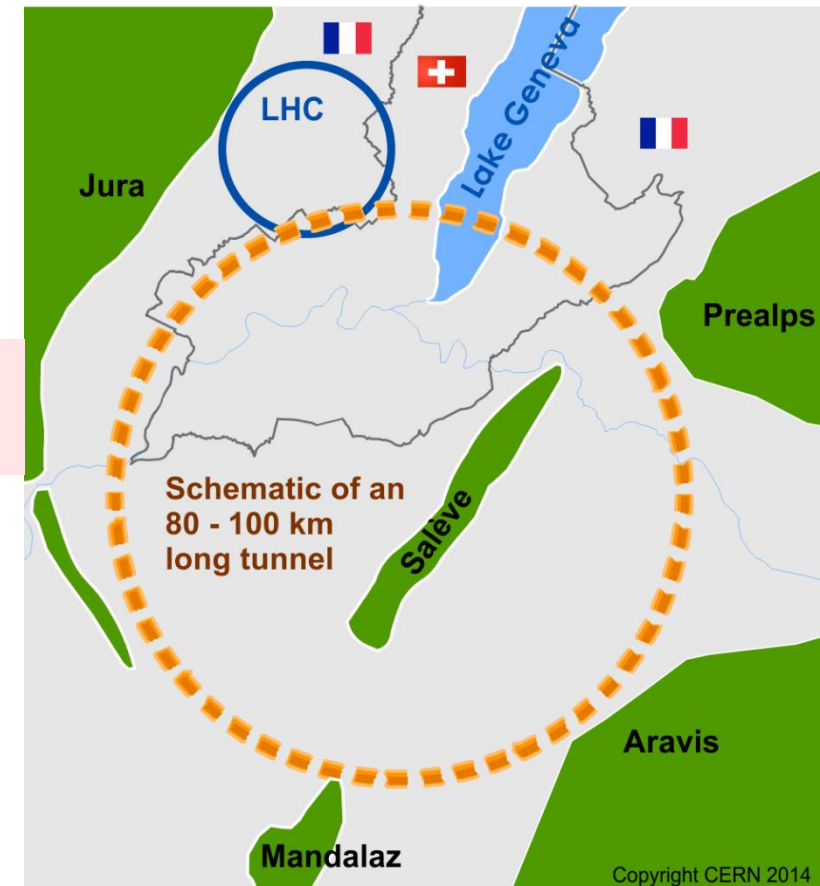

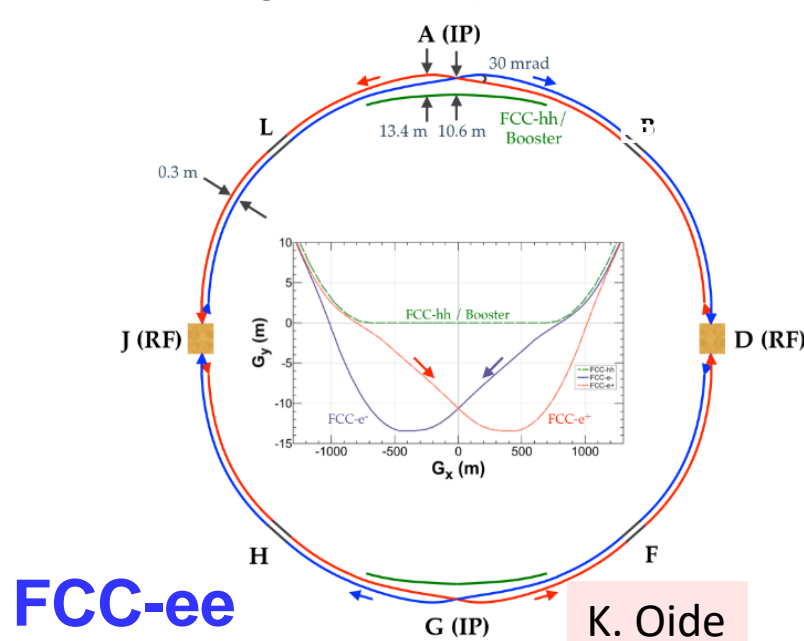

→ launch of Future Circular Collider Feasibility Study in summer 2021

# The Future Circular Collider integrated program inspired by successful LEP – LHC programs at CERN

comprehensive long-term program maximizing physics opportunities

- stage 1: FCC-ee (Z, W, H,  $t\bar{t}$ ) as Higgs factory, electroweak & top factory at highest luminosities
- stage 2: FCC-hh (~100 TeV) as natural continuation at energy frontier, with ion and eh options
- complementary physics
- common civil engineering and technical infrastructures
- building on and reusing CERN's existing infrastructure
- FCC integrated project allows seamless continuation of HEP after HL-LHC

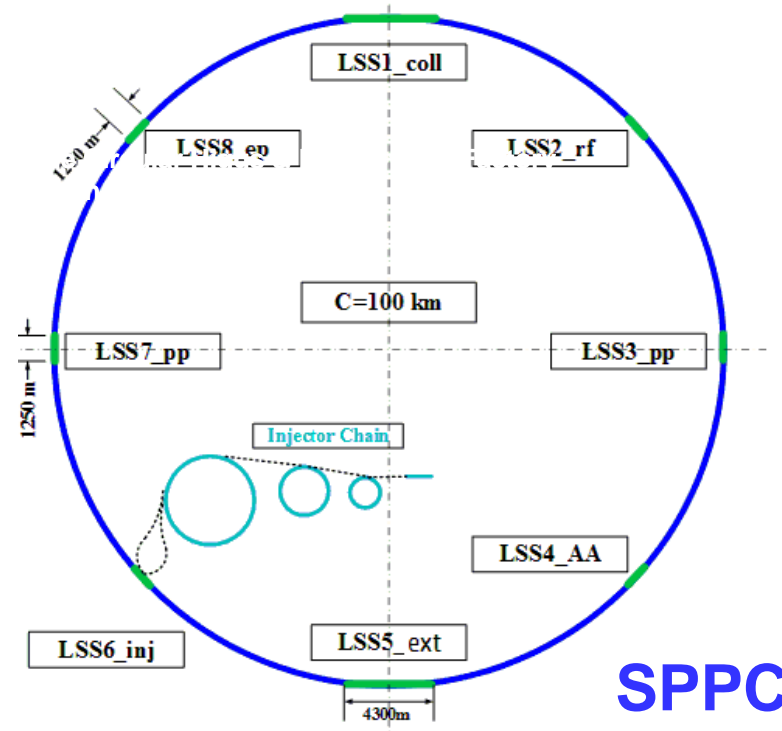

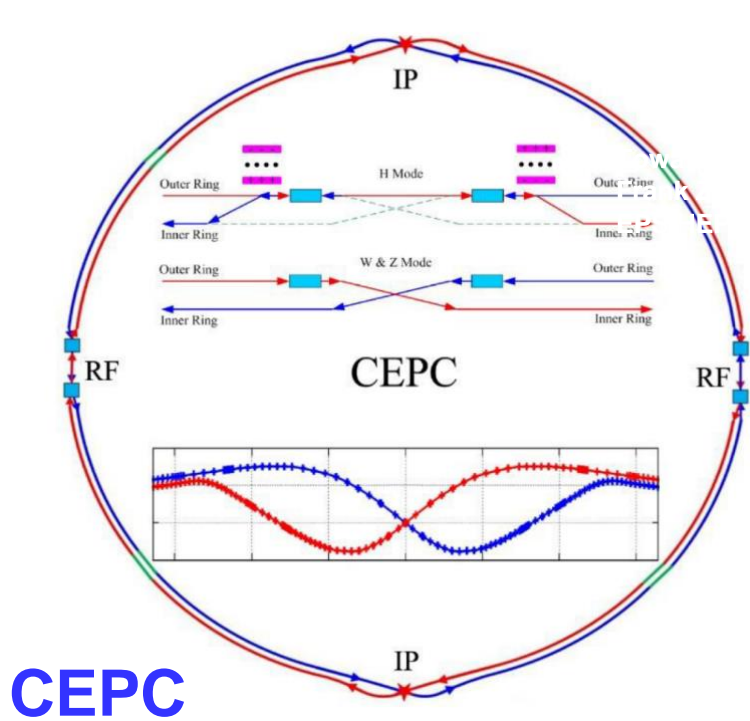

# independent R&D in China → “same” solution

comprehensive long-term program maximizing physics opportunities

- stage 1: CEPC (Z, W, H, optionally  $t\bar{t}$  ?) as Higgs factory, electroweak & top factory at highest luminosities
- stage 2: SPPC (~75 TeV) as natural continuation at energy frontier
- complementary physics
- common civil engineering and technical infrastructures, **green field construction**

J. Gao, Y. Wang

**double ring  $e^+e^-$  collider**

**common footprint with FCC-hh,**  
except around IPs

**asymmetric IR layout and optics** to limit  
synchrotron radiation towards the detector

**2 IPs, large horizontal crossing angle 30 mrad,**  
**crab-waist collision optics**  
(**alternative layouts with 4 IPs under study**)

**synchrotron radiation power 50 MW/beam**  
at all beam energies

**top-up injection** scheme for high luminosity  
requires **booster synchrotron** in collider tunnel

# FCC-ee CDR baseline parameters with 2 IPs

parameter	Z	WW	ZH	$t\bar{t}$	LEP2

RF voltage [GV]	0.75	2.0	4.0 + 6.9	3.5	3.5
rms bunch length (SP+BS) [mm]	3.5, 12	3.0, 6.0	3.2, 5.3	2.0, 2.5	12, 12
rms emittance $\epsilon_{x,y}$ [nm, mm]	0.27, 1	0.84, 1.7	0.63, 1.3	1.5, 2.9	22, 250
longit. damping time [turns]	1273	236	70	20	31
vert. IP beta function $\beta_y^*$ [mm]	0.8	1.0	1.0	1.6	50
beam lifetime, rad. Bb + BS [min]	68	59	12	12	434

# bunches reduced at higher energy,  
much smaller  $\beta^*$  & emittance than LEP,  
beamstrahlung affects  $\sigma_z$  and  $\tau$

# luminosity per IP for 4 (5) modes of operation

**physics run plan**

# FCC-ee design concept

based on lessons and techniques from past colliders (last 40 years)

**B-factories: KEKB & PEP-II:**

**double-ring lepton colliders,  
high beam currents,  
top-up injection**

**DAFNE: crab waist, double ring**

**S-KEKB: low  $\beta_y^*$ , crab waist**

**LEP: high energy, SR effects**

**VEPP-4M, LEP: precision E calibration**

**KEKB:  $e^+$  source**

**HERA, LEP, RHIC: spin gymnastics**

Marica Biagini

combining successful ingredients of several recent colliders → highest luminosities & energies

# new: FCC-ee asymmetric crab-waist IR optics

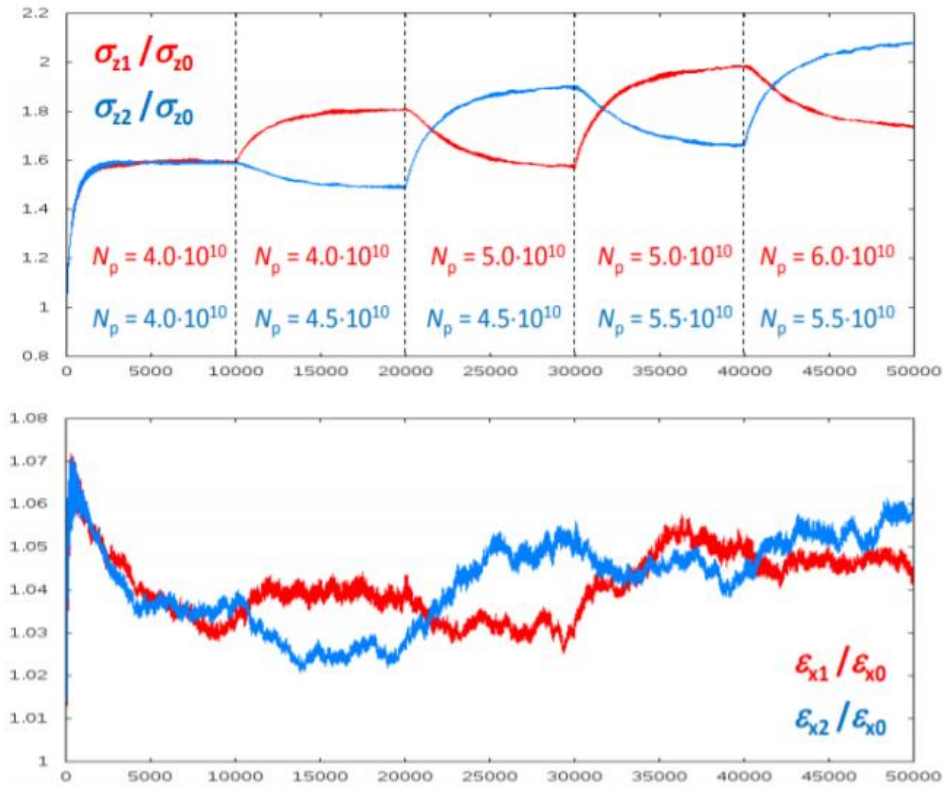

**Novel asymmetric IR optics** to suppress synchrotron radiation toward the IP,  $E_{\text{critical}} < 100$  keV from **450 m from IP (e) – lesson from LEP**

**4 sextupoles (a – d) for local vertical chromaticity correction combined with crab waist, optimized for each working point – novel “virtual crab waist”, standard crab waist demonstrated at DAFNE**

K. Oide et al., Design of beam optics for the future circular collider  $e^+e^-$  collider rings, *Phys. Rev. Accel. Beams* **19**, 111005 (2016).

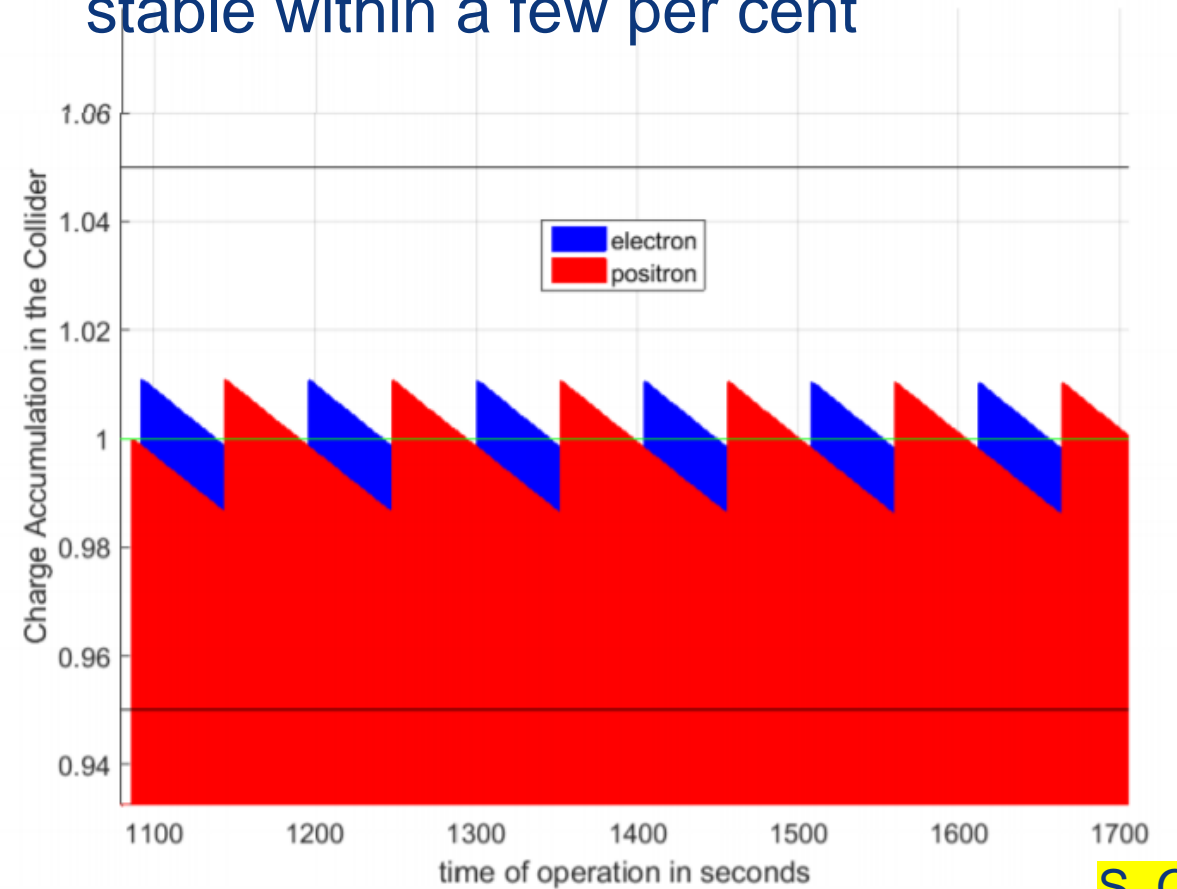

# new: “bootstrapping” & top-up injection

injection from zero, alternating between beams to avoid beam-beam flip-flop effect

D. Shatilov

alternating replenishment of the two colliding beams, keeping beam currents stable within a few per cent

S. Ogur

average luminosity ~ peak luminosity

# SuperKEKB – “FCC-ee demonstrator”

Double ring  $e^+e^-$  collider  $B$ -factory at 7( $e^-$ ) & 4( $e^+$ ) GeV; design luminosity  $\sim 8 \times 10^{35} \text{ cm}^{-2}\text{s}^{-1}$ ; design  $\beta_y^* \sim 0.3 \text{ mm}$ ; beam lifetime  $\sim 5 \text{ min}$ ; top-up inj.;  $\sim 2.5 \times 10^{12} e^+ / \text{s}$ ; **under commissioning**

SuperKEKB is demonstrating FCC-ee key concepts

Y. Funakoshi, Y. Ohnishi, K. Oide

$\beta_y^* = 0.8 \text{ mm}$  achieved in both rings – using the FCC-ee-style “virtual” crab-waist collision scheme

new world record  $L = 3.12 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$  on 22 June '21

# KEKB, SuperKEKB '21, SuperKEKB design

parameter	KEKB w Belle		SuperKEKB 2021 w Belle II		SuperKEKB design	
	LER	HER	LER	HER	LER	HER
E [GeV]	3.5	8	4	8	4	8
$\beta_x^*$ (mm)	1200	1200	1200	1200	1200	1200
$\beta_y^*$ (mm)	5.9	5.6	5.9	5.6	0.30	0.30
$\epsilon_x$ (nm)	18	18	18	18	4.6	4.6
$\epsilon_y$ (pm)	8.6	8.6	8.6	8.6	12.9	12.9
I (mA)	3600	3600	3600	3600	2600	2600
$n_b$	2500	2500	2500	2500	2500	2500
$I_b$ (mA)	1.44	1.44	0.585	0.585	1.44	1.04
$\xi_{y^*}$	0.069	0.069	0.046	0.030	0.069	0.060
$L_{sp}$ ( $10^{30} \text{cm}^{-2}$ )	67.6	67.6	67.6	67.6	214	214
L ( $10^{34} \text{cm}^{-2} \text{s}^{-1}$ )	3.12	3.12	3.12	3.12	80	80

50% more luminosity than KEBB with half the beam currents → greatly 6x improved “efficiency” – concepts validated – , but still long way to go

# SuperKEKB – lessons learnt & present limits

## FCC-ee demonstrator

- FCC-ee type “**virtual crab waist**” **collisions** (K. Oide, Phys. Rev. Accel. Beams 19, 111005) work well at S-KEKB
- **smallest  $\beta_y^*$  considered for FCC-ee: 1 mm and 0.8 mm**
- $e^+$  prod. rate similar to FCC-ee’s – feasibility shown ; **top-up injection w. <10 min beam lifetime**

## SuperKEKB challenges

- **design luminosity optimistic**: ~2x higher than simulated for ideal case w/o impedance & w/o errors
- **bunch currents and esp. beam currents lower than design**: LER TMCI threshold (impedance model!); bunch lengthening (imp. model) sudden beam losses in the LER (noise?); poor injection efficiency (emittance growth in HER transfer line - CSR?!); beam-beam blow up; collimation & machine protection (aperture bottlenecks near experiment); collision stability; lack of beam diagnostics; aging equipment (inherited from TRISTAN) ; **aging accelerator experts (many working far beyond retirement age)**
- **vertical emittances 4-10x too large, even at low current & w/o collision**
- **$\beta_y^*$  still 3-4 times larger than design**: detector background, limited IR aperture & large emittance of inj. beam

**New International Task Force was formed two months ago to address these challenges**

# precise energy calibration by res. depolarisation

Z pole with polarisation wigglers

E. Gianfelice-Wendt, *Investigation of beam self-polarization in the future  $e^+e^-$  circular collider*, Phys. Rev. Accel. Beams 19, 101005 (2016).

orbit correction

+ harmonic bumps

**Z pole: 8 asymmetric wigglers per beam** lower the polarisation rise time to 12 hours allowing a level of 10% (5%) beam polarisation, sufficient for the energy calibration by RDP, to be obtained in 90 (45) minutes.  
**W pair threshold: spontaneous polarisation** with a rise-time of around 10 hours without wigglers.

WW threshold

orbit correction

**for Z and W precise energy calibration at  $10^{-6}$  level**  
 localised in one point! largest remaining systematic error: vertical closed-orbit distortions - at the Z, 100  $\mu$ m error will induce a possible systematic shift of around 45 keV.  
 ~200  $e^+e^-$ -colliding 'pilot' bunches injected at start of fill and polarised using wigglers

simulated frequency sweep with depolariser

N. Muchnoi, arXiv:1803.09595 (2018).

luminosity-averaged centre-of-mass uncertainty:

~100 keV at Z pole  
 ~300 keV at W pair threshold

A. Blondel, P. Janot, J. Wenninger et al.

# monochromatized direct Higgs production at 125 GeV c.m. to measure $e^-$ Yukawa coupling ?

$$D_x^* \neq 0$$

w crab cavities

w/o crab cavities

including beamstrahlung

integrated resonance scan

M.A. Valdivia Garcia,  
A. Faus-Golfe, A. Blondel,  
F. Zimmermann et al.

a few times higher Higgs production rate  
thanks to monochromatization

possibly the only available approach to  
measure the electron Yukawa coupling !

# FCC-hh basic design choices for CDR

D. Schulte,  
A. Chance  
et al.

- dual aperture superconducting magnets
- two high-luminosity experiments (A & G)
- two other experiments (L & B) combined with injection upstream of experiments
- two collimation insertions
  - betatron cleaning (J)
  - momentum cleaning (F)
- extraction/dump insertion (D)
- RF insertion (H)
- Injection from LHC ( $\sim 3$  TeV) or scSPS ( $\sim 1.2$  TeV)
- Alternative layouts under study

# FCC-hh (pp) parameters

parameter	FCC-hh		HL-LHC	LHC
collision energy cms [TeV]	100		14	14
dipole field [T]	16		8.33	8.33
circumference [km]	97.75		26.7	26.7

# FCC-hh & SPPC: performance

order of magnitude performance increase in energy & luminosity

100 TeV cm collision energy (vs 14 TeV for LHC)

FCC-hh : 20  $\text{ab}^{-1}$  per experiment collected over 25 years of operation, SPPC: ~ 10  $\text{ab}^{-1}$  over 25 years (vs 3  $\text{ab}^{-1}$  for LHC)

similar performance increase as from Tevatron to LHC

**key technology: high-field magnets**

# worldwide FCC Nb<sub>3</sub>Sn program

Main development goal is wire performance increase:

- $J_c$  (16T, 4.2K) > 1500 A/mm<sup>2</sup> → 50% increase wrt HL-LHC wire
- Reduction of coil & magnet cross-section

After 1-2 years development, prototype Nb<sub>3</sub>Sn wires from several new industrial FCC partners already achieve HL-LHC  $J_c$  performance

FCC conductor development collaboration:

- Bochvar Institute (production at TVEL), **Russia**
- Bruker, **Germany**, Luvata Pori, **Finland**
- KEK (Jastec and Furukawa), **Japan**
- KAT, **Korea**, Columbus, **Italy**
- **University of Geneva, Switzerland**
- **Technical University of Vienna, Austria**
- SPIN, **Italy**, University of Freiberg, **Germany**

2019/20 results from US, meeting FCC  $J_c$  specs:

- Florida State University: high- $J_c$  Nb<sub>3</sub>Sn via Hf addition
- Hyper Tech /Ohio SU/FNAL: high- $J_c$  Nb<sub>3</sub>Sn via artificial pinning centres based on Zr oxide.

CEA

Short model magnets (1.5 m lengths) will be built until 2025

# US – MDP: 14.5 T magnet tested at FNAL

- 15 T dipole demonstrator
- Staged approach: In first step pre-stressed for 14 T
- Second test in June 2020 with additional pre-stress reached 14.5 T

## present baseline position was established considering:

- lowest risk for construction, fastest and cheapest construction
- feasible positions for large span caverns (most challenging structures)
- 90 – 100 km circumference
- 12 surface sites with ~5 ha area each → recent studies on 8 surface s.

# Civil engineering studies

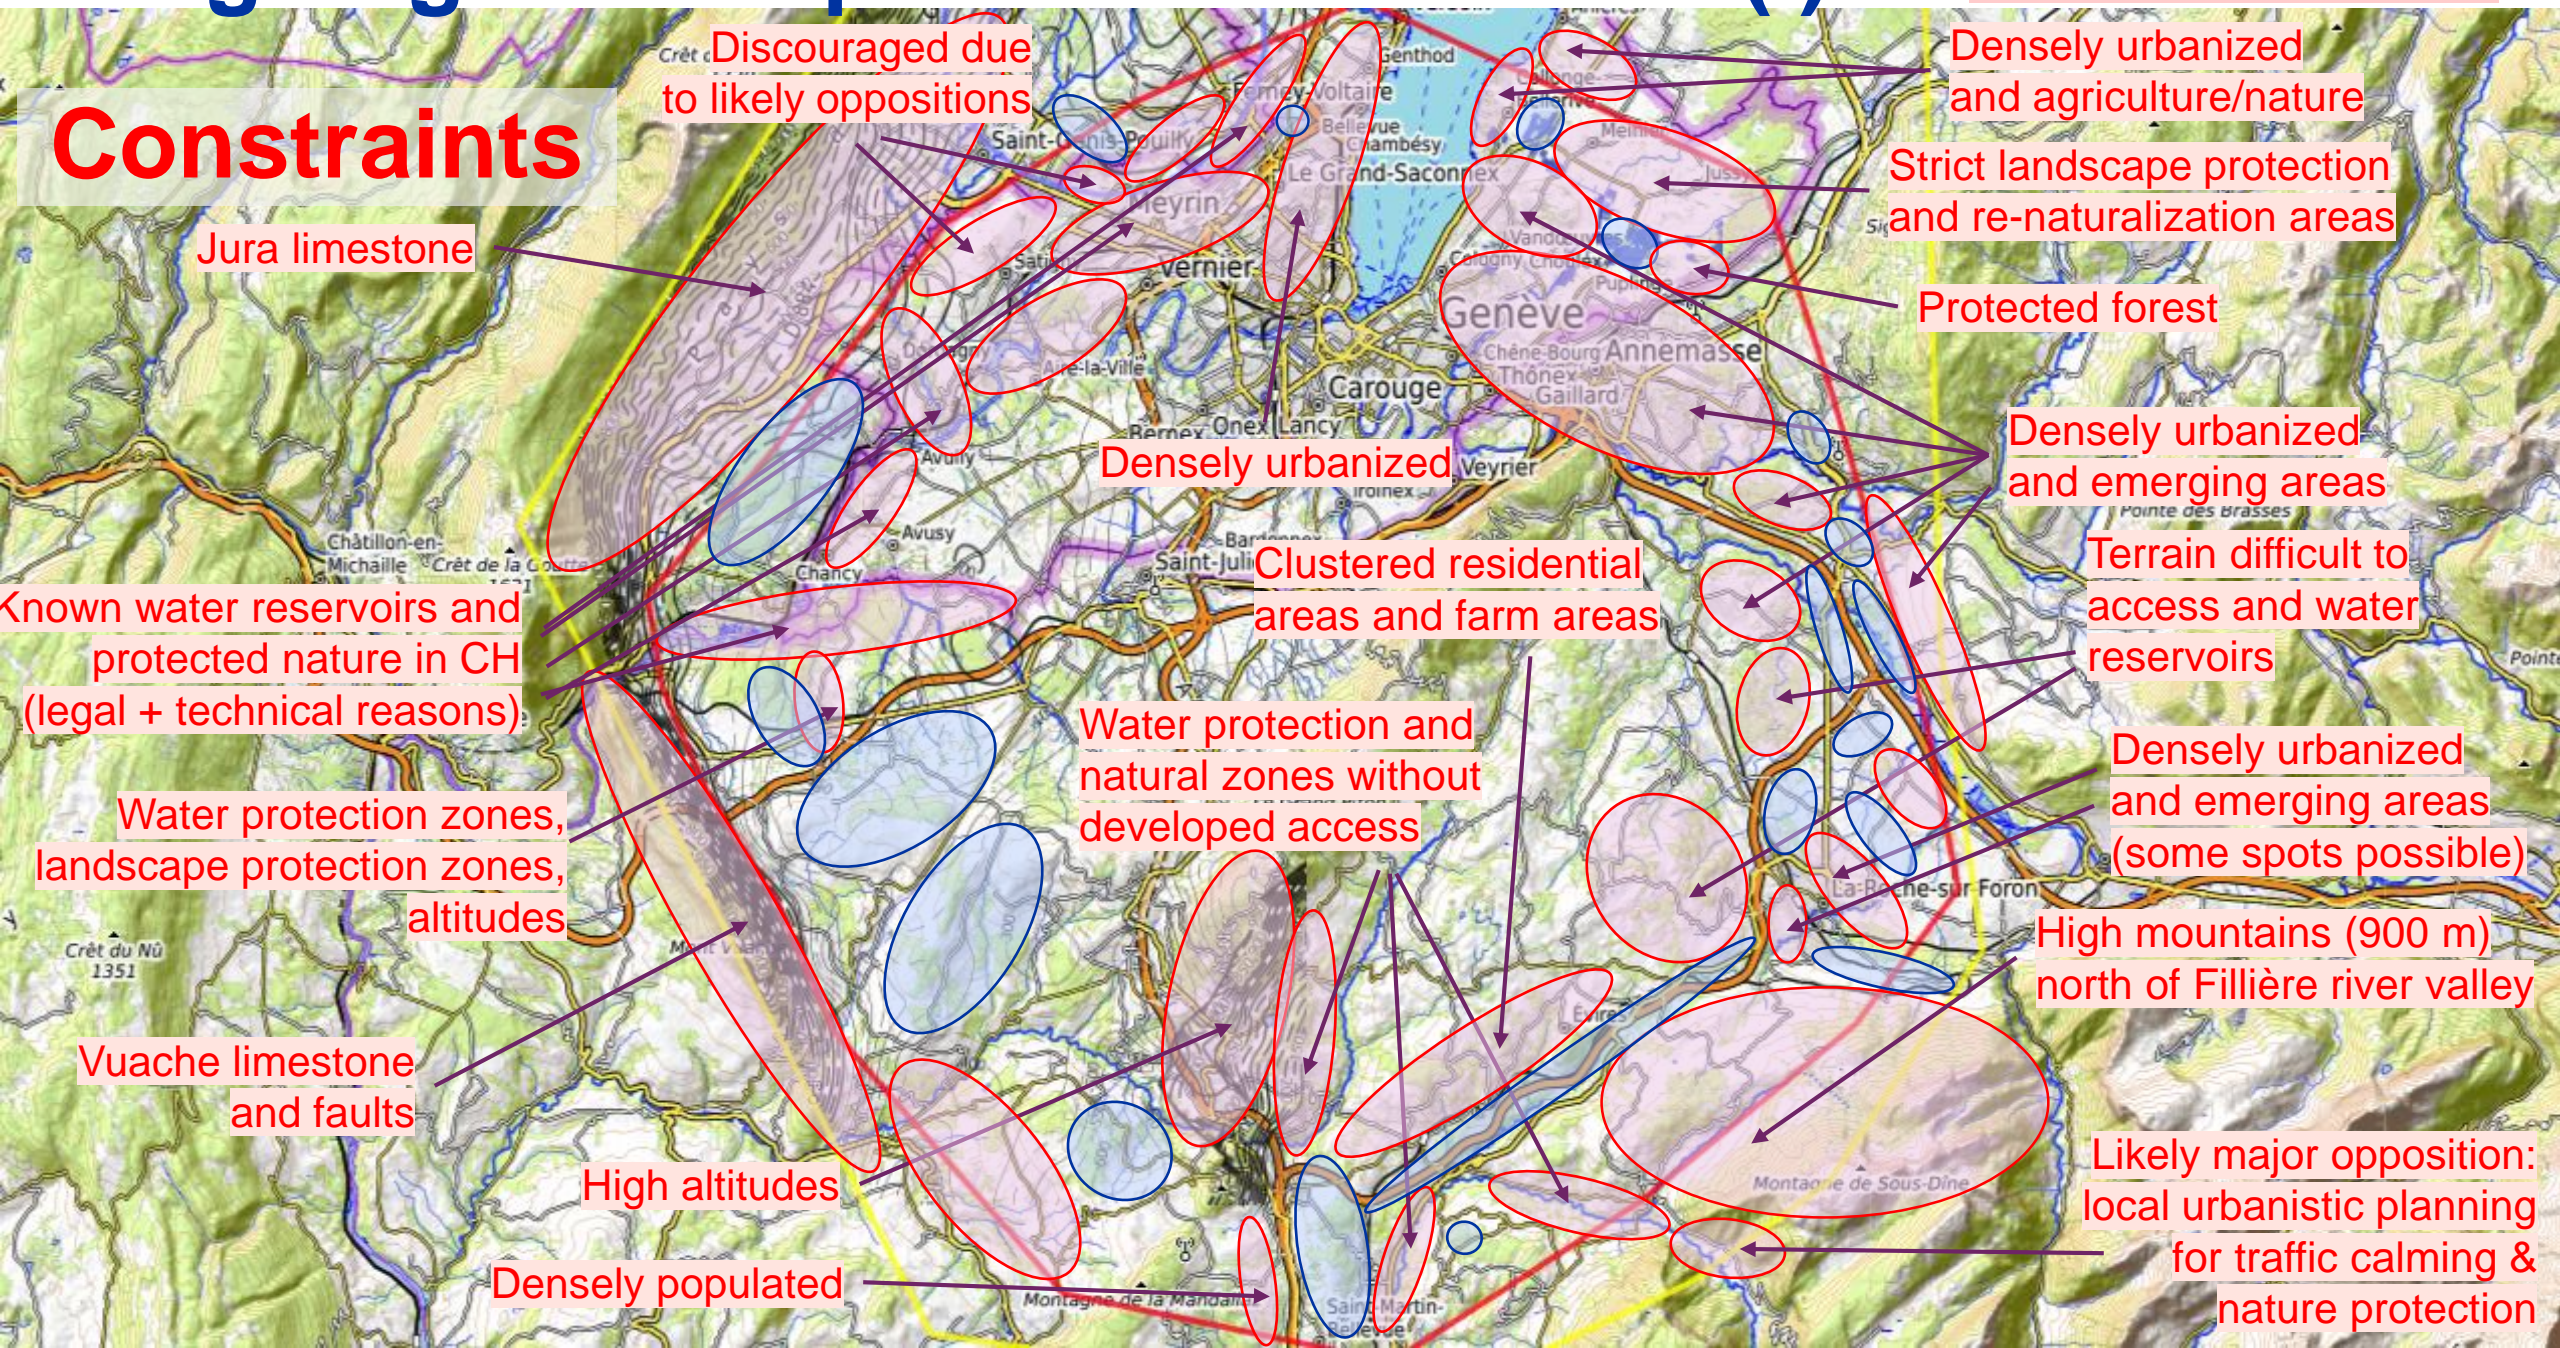

- Total construction duration 7 years
- First sectors ready after 4.5 years for start of technical infrastructure installation

# Ongoing work – placements studies (i)

J. Gutleber, V. Mertens

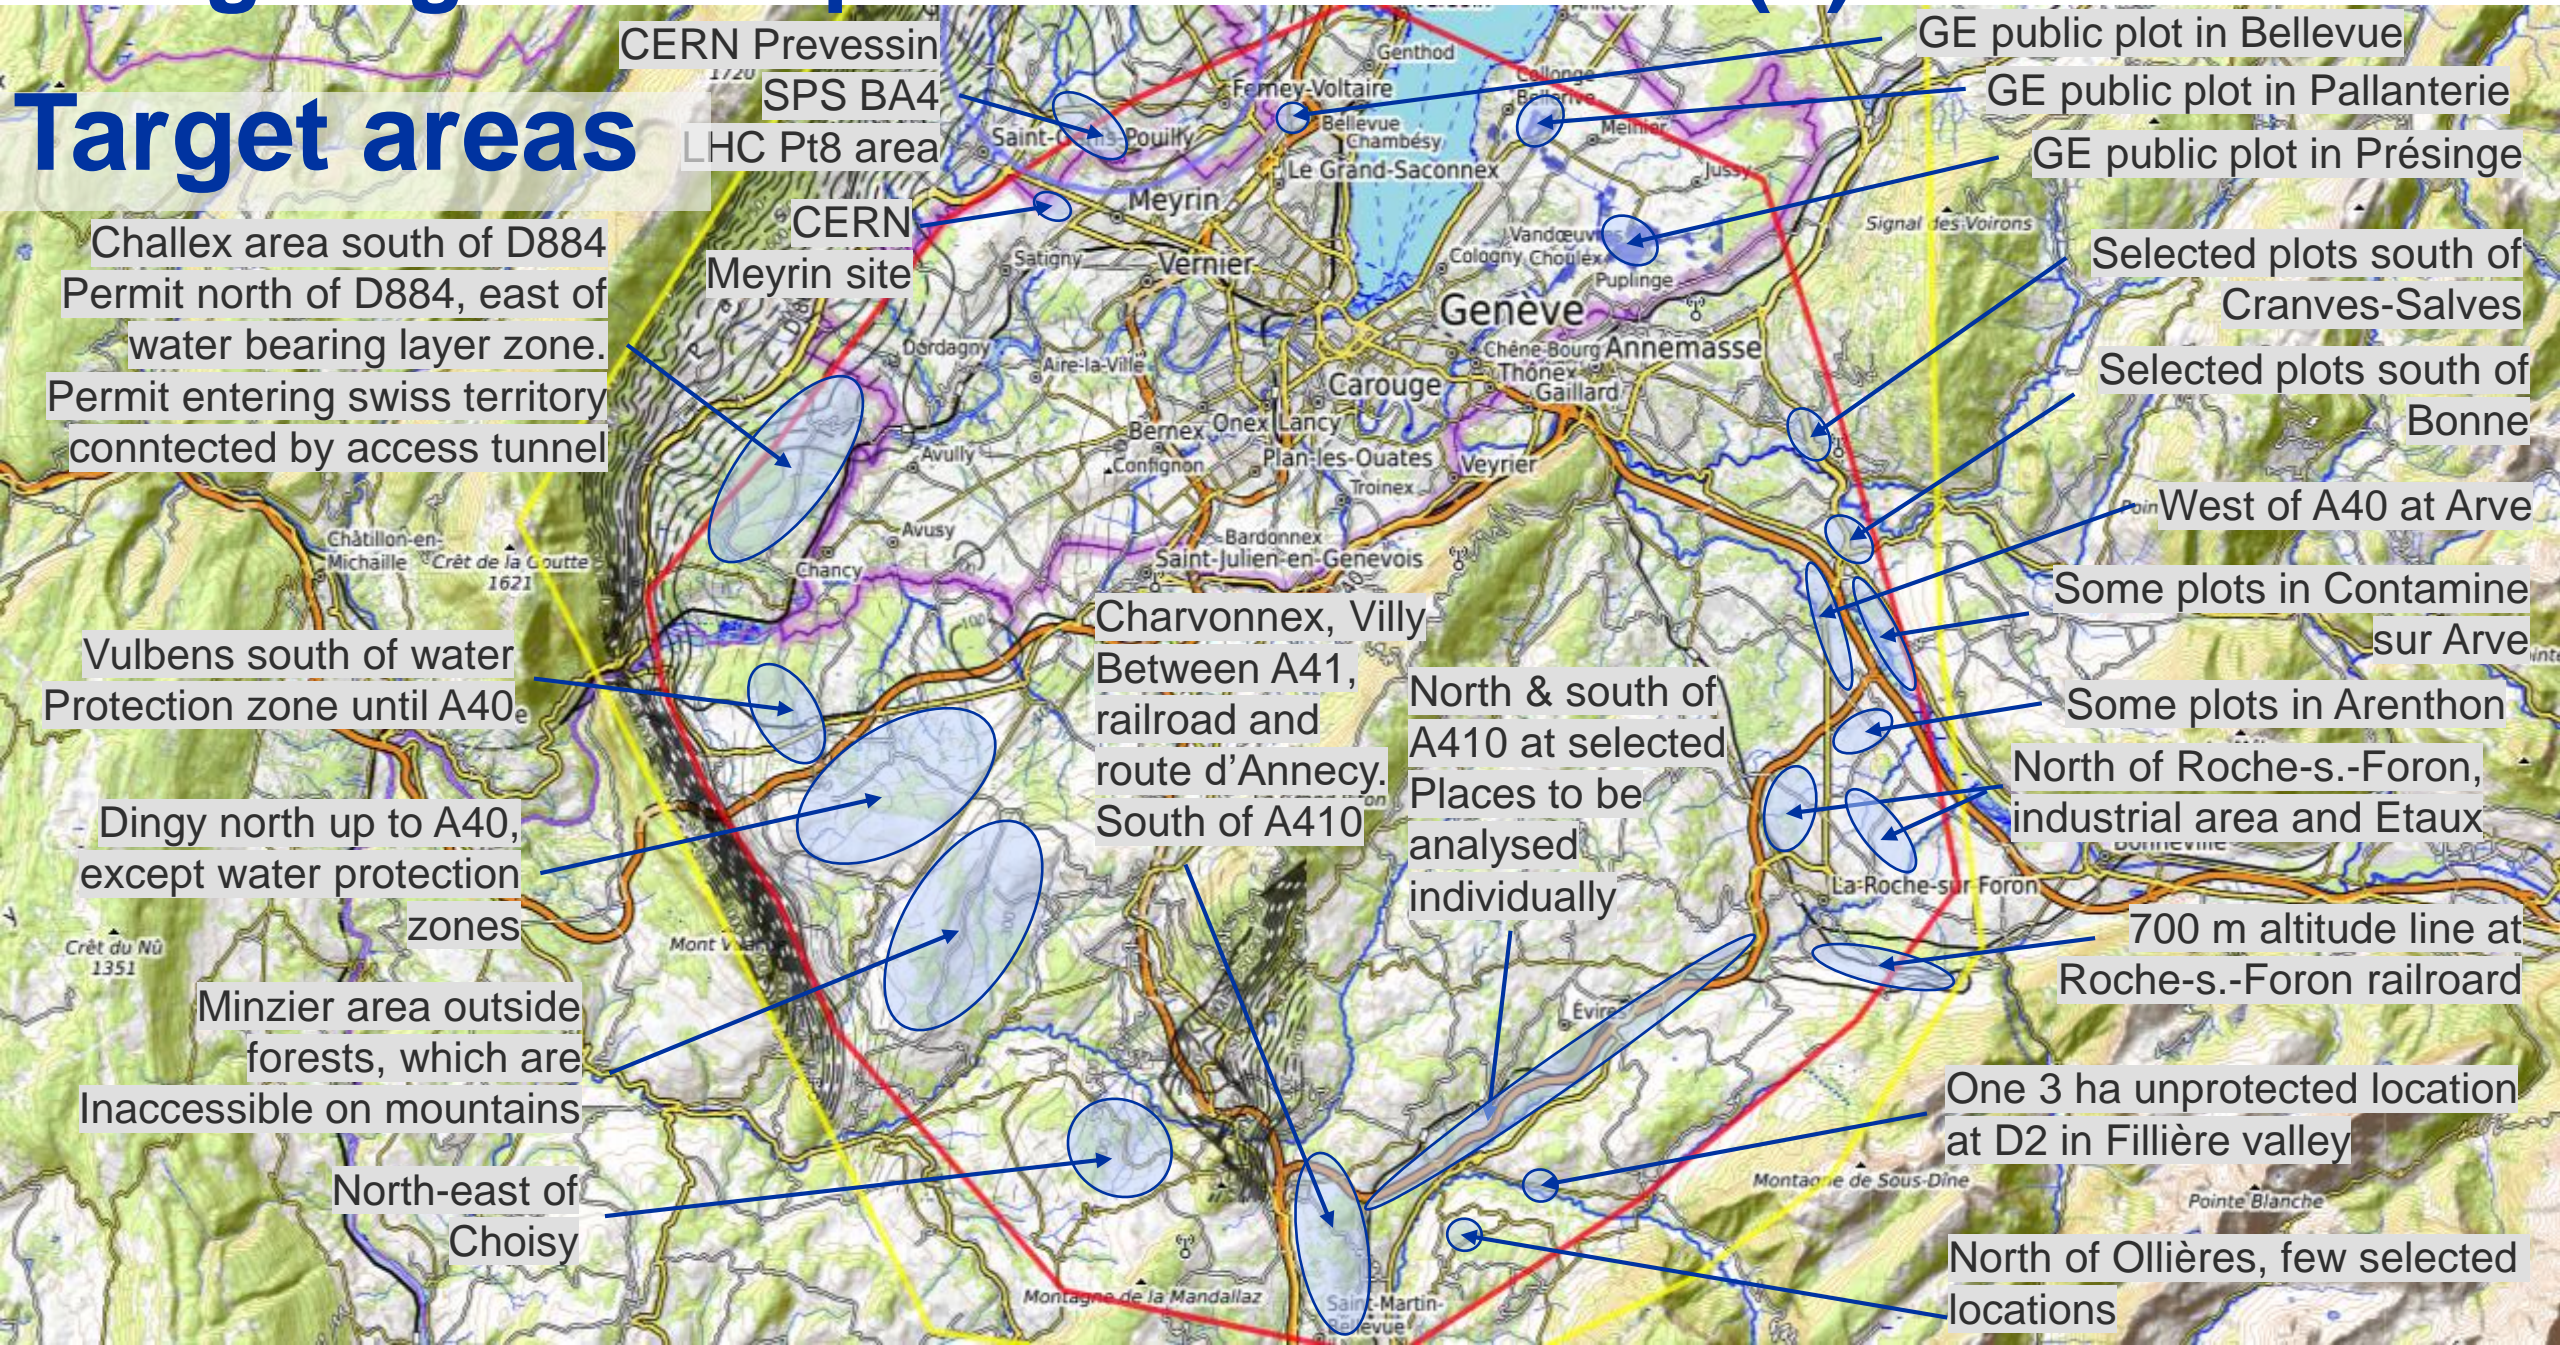

## Constraints

# Ongoing work – placements studies (ii)

J. Gutleber, V. Mertens

## Target areas

# new "lowest risk" placement/optics allows 4 exp's

C=91 km

J. Gutleber

perfect symmetry and  
**perfect 4-fold superperiodicity**

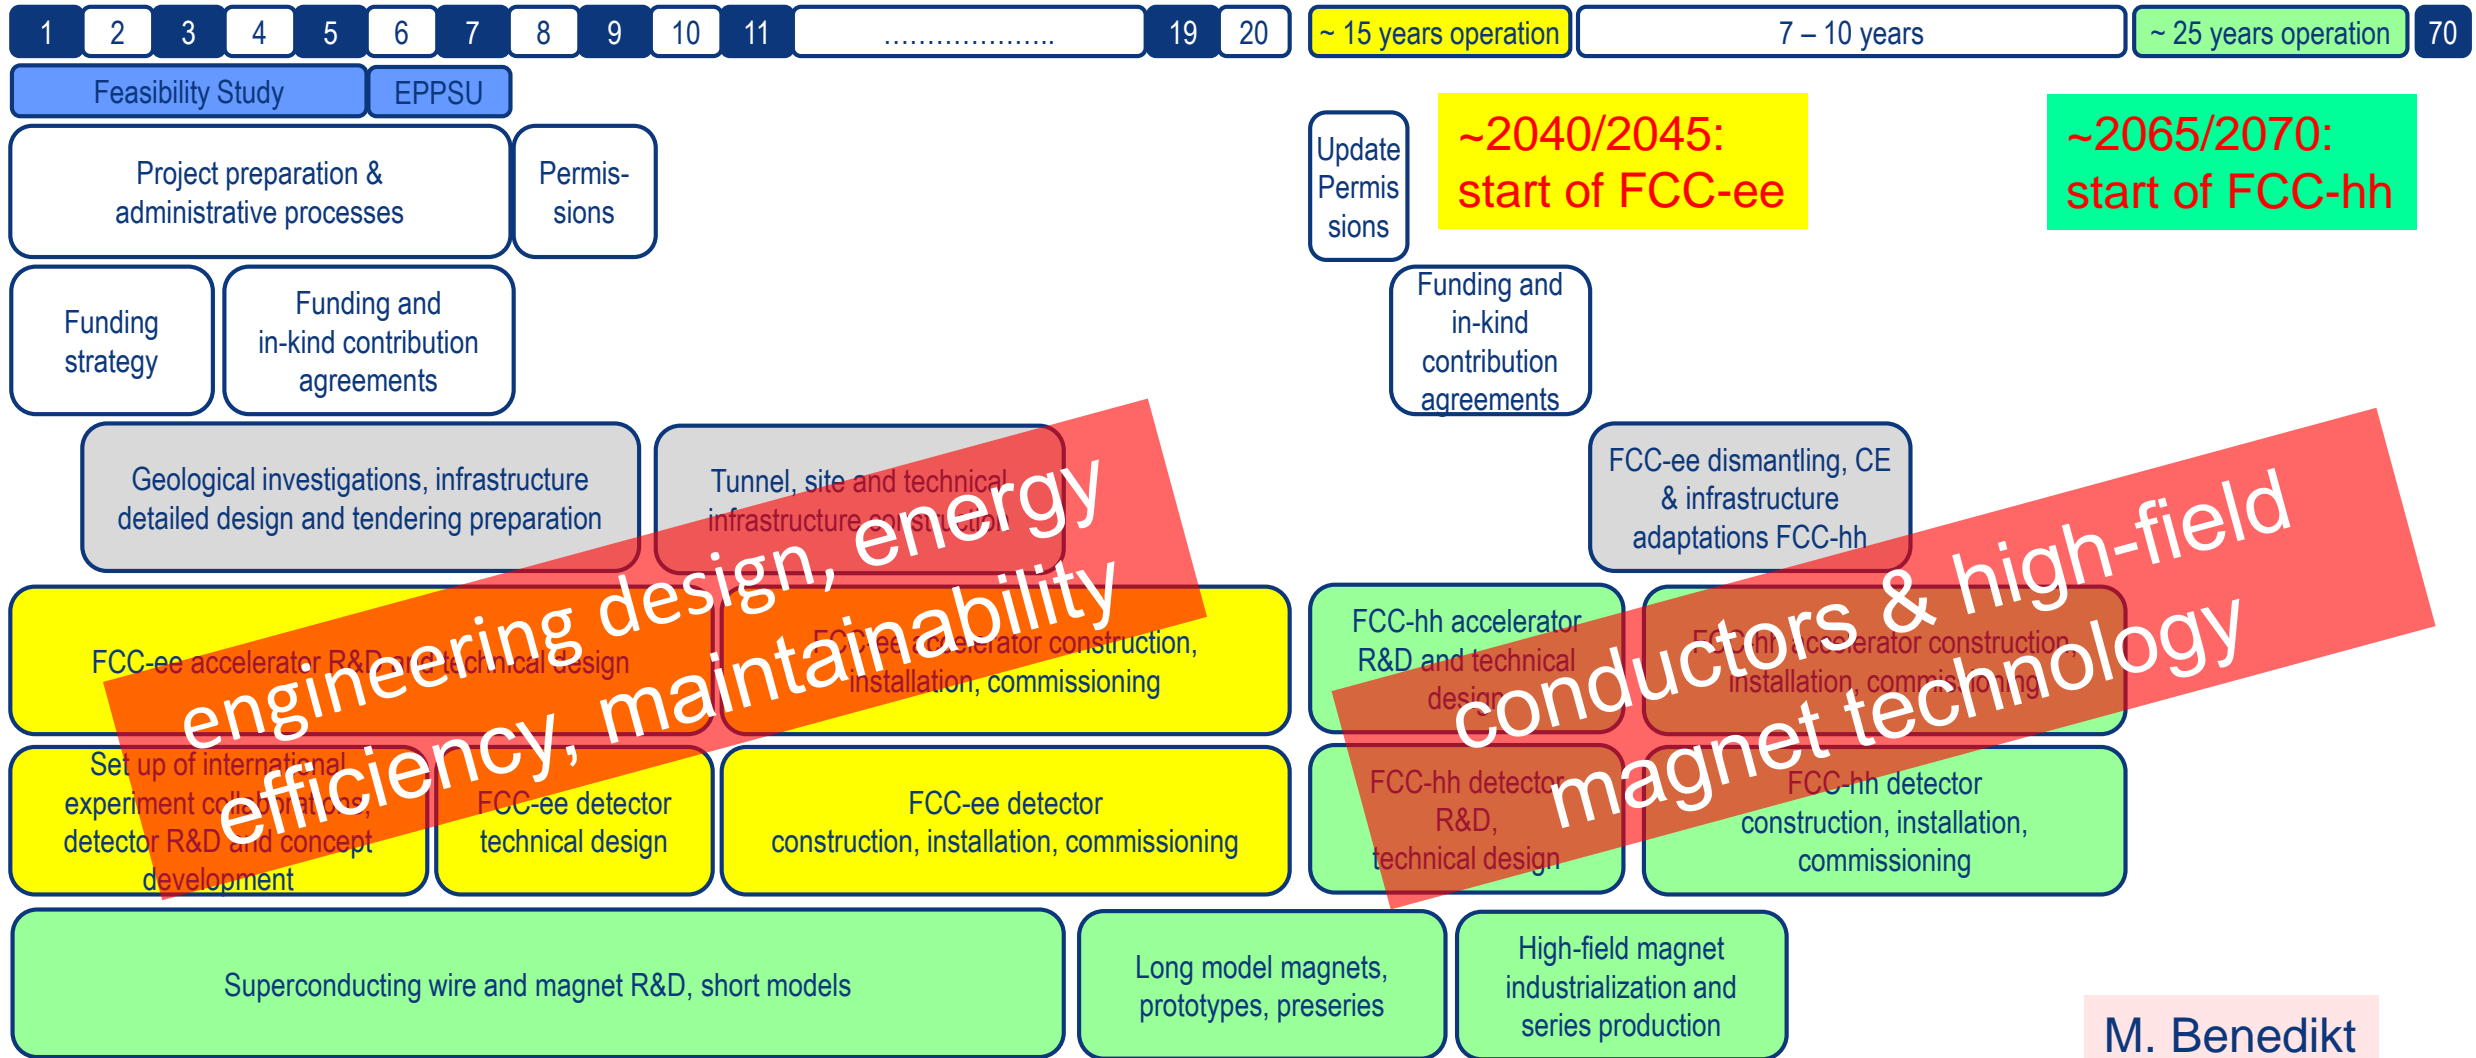

8 surface sites

beam optics for 1/4 ring

M. Benedikt

# ESPPU 2020 “Environmental and societal impact”

- The environmental impact of particle physics activities should continue to be carefully studied and minimised. A detailed plan for the **minimisation of environmental impact** and for the **saving and re-use of energy** should be part of the approval process for any major project.

## Luminosity vs. capital cost

- for the H running, with  $5 \text{ ab}^{-1}$  accumulated over 3 years and  $10^6$  H produced, the total investment cost ( $\sim 10$  BCHF) corresponds to  $\rightarrow$  **10 kCHF per produced Higgs boson**
- for the Z running with  $150 \text{ ab}^{-1}$  accumulated over 4 years and  $5 \times 10^{12}$  Z produced, the total investment cost corresponds to  $\rightarrow$  **10 kCHF per  $5 \times 10^6$  Z bosons**

This is the number of Z bosons collected by each experiment during the entire LEP programme !

**Capital cost per luminosity dramatically decreased compared with LEP !**

## Luminosity vs. electricity consumption

**Highest lumi/power of all proposals  
Electricity cost  $\sim 200$  CHF per Higgs boson**

# energy consumption – example CERN today

V. Mertens

continually supplying circulating beam with

$P_{SR}=100$  MW power (SR losses) requires

wall-plug power  $P_{wall}=P_{SR}/\eta$  , note beam current  $I_b \propto L \propto P_{SR}$

with  $\eta$ =conversion efficiency wall-plug  $\rightarrow$  beam

## FCC strategy:

- RF system optimized for each energy
- high-gradient high-Q SC cavities (low cryo power)
- highly efficient RF power sources

# FCC-ee RF staging scenario (CDR)

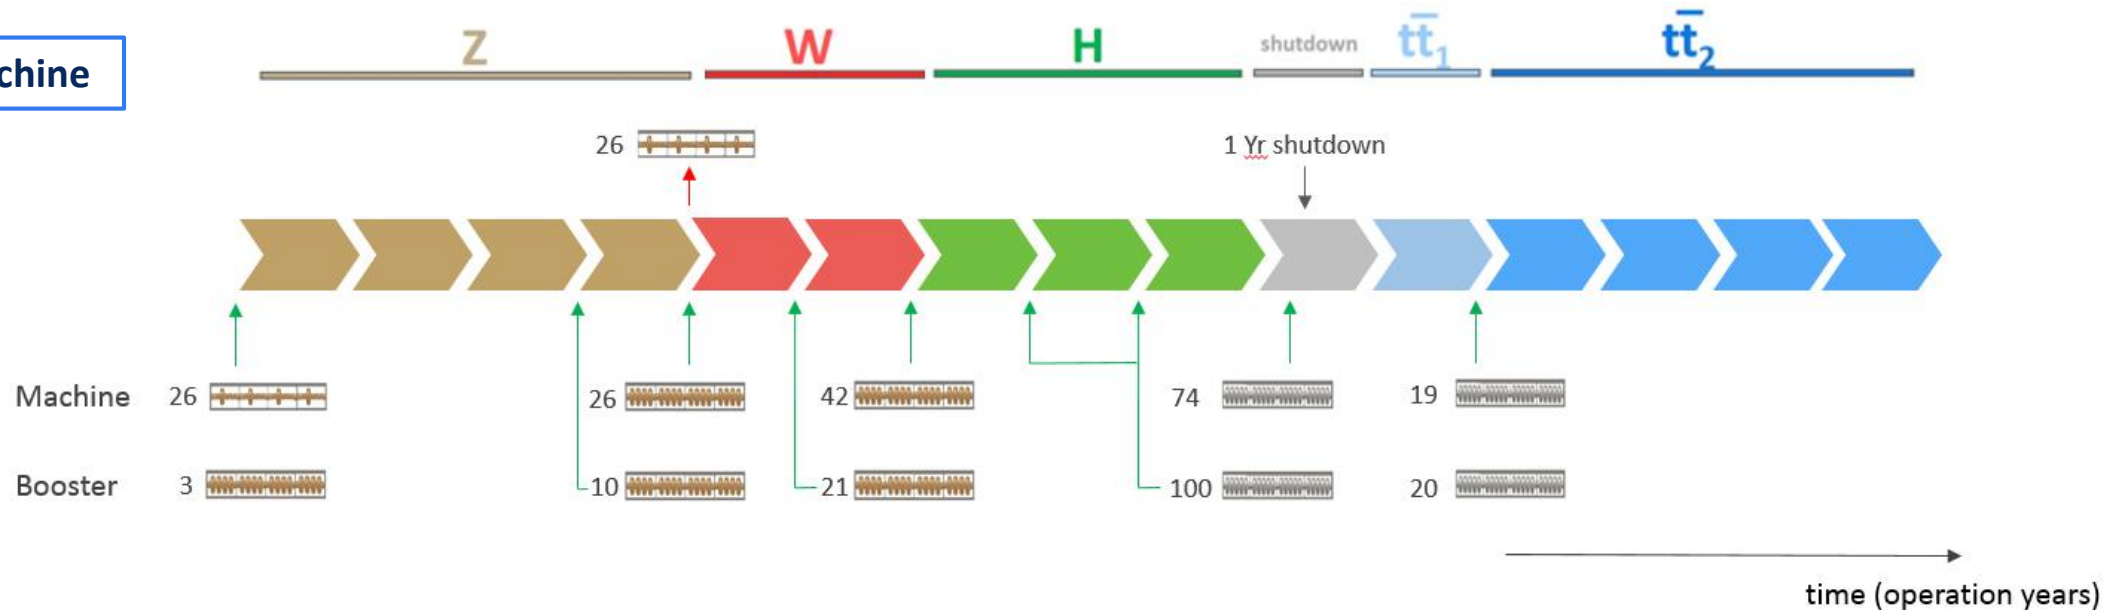

“Ampere-class” machine

WP	$V_{rf}$ [GV]	#bunches	$I_{beam}$ [mA]
Z	0.1	16640	1390
W	0.44	2000	147
H	2.0	393	29
ttbar	10.9	48	5.4

three sets of RF cavities to cover all options for FCC-ee & booster:

- high intensity (Z, FCC-hh): 400 MHz mono-cell cavities (4/cryom.)
- higher energy (W, H, t): 400 MHz four-cell cavities (4/cryomodule)
- ttbar machine complement: 800 MHz five-cell cavities (4/cryom.)
- installation sequence comparable to LEP ( $\approx 30$  CM/shutdown)

“high-gradient” machine

# "green" energy efficient technologies

more efficient RF power sources

I. Syratchev

more efficient SC cavities

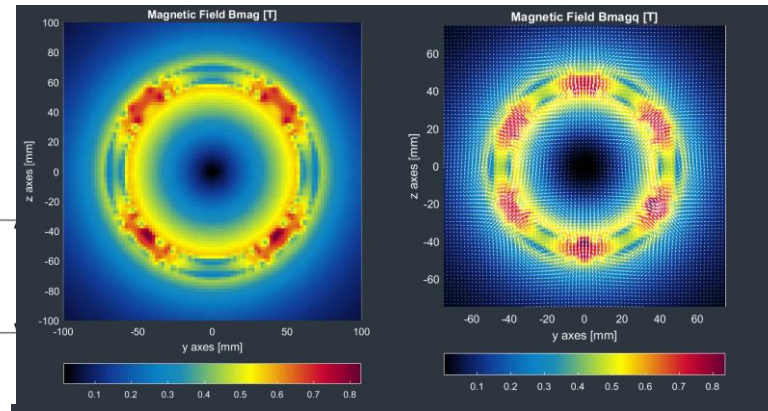

A. Grassellino

twin aperture dipoles for FCC-ee

A. Milanese

M. Koratzinos

CCT HTS quadrupoles & sextupoles for FCC-ee

**FCC-ee ~100 MW at all beam energies (design constraint)**

**FCC-hh ~ 5 MW total SR power in arcs from proton beams, emitted inside the cold magnets**

**→ strategy: SR absorption on “beam screen” (BS) at  $T \gg 1.9$  K**

FCC-hh BS temperature choice through overall optimisation:

- cryoplant power consumption
- vacuum system performance
- impedance and beam stability

L. Taviani,  
P. Lebrun

# ESPP Update 2020 “High-priority future initiatives” - 2

- the particle physics community should ramp up its **R&D effort focused on advanced accelerator technologies**, in particular that for **high-field superconducting magnets**, including **high-temperature superconductors**
  - **directly relevant for energy frontier hadron collider (FCC-hh), for HTS applications at FCC-ee (certain collider magnets, e<sup>+</sup> target solenoid, etc.), & future muon collider**
- the technologies under consideration include **high-field magnets, high-temperature superconductors, plasma wakefield acceleration and other high-gradient accelerating structures, bright muon beams, energy recovery linacs**. The European particle physics community must **intensify accelerator R&D** and sustain it .... A **roadmap should prioritise the technology**,...

## 5 expert panels:

- High-field magnets
- High-gradient acceleration
- RF structures
- Muon beams
- Energy recovery linacs

# High-Field Magnets – Challenge Force Management

horizontal forces per quadrant in dipole accelerator magnets (built and tested or design studies)

# High-Field Magnets - R&D Program Goals

# High-Gradient Acceleration (Plasma/Laser)

This accelerator fits into a human hair

# High-Gradient Acceleration (Plasma/Laser) – cont'd

A plasma cell compared with the superconducting accelerator FLASH (credit DESY)

# High-Gradient Acceleration (Plasma/Laser) – cont'd

State of field: Rapidly progressing (e.g. first FEL SASE lasing) – low energy RI's planned (outside HEP) – national, European, international efforts – wish to **advance HEP concepts**

## Electron beam with collider quality

1-10 GV/m acceleration, 15,000 nC/s charge delivered, sub-micron transverse emittances,  $10^{-4}$  rel. energy spread, spin polarization.

**Deliverables** on injectors, numerical simulations, repetition rate, efficiency, beam loading, emittance preservation, energy spread control, polarization, staging, ... were proposed.

## Solution for positron acceleration

with parameters similar to electron bunches.

**Deliverables** on numerical simulations, proof-of-principle experiments were proposed.

MAIN  
CHA  
LLEN  
GES

## Conceptual design advanced collider

with physics case, self-consistent machine parameter set, realistic assessment of feasibility issues, performance, size and cost.

**Deliverables** on a coordinated international design study, including beam delivery, luminosity and interaction region design, were proposed.

## Intermediate steps towards a particle physics collider and synergy

with progress in photon science and lower energy applications.

**Deliverables** for intermediate implementation steps were proposed.

# plasma acceleration of positrons ? (required for e<sup>+</sup>e<sup>-</sup> collider)

“ballistic injection”:  
a ring-shaped laser  
beam and a  
coaxially  
propagating  
Gaussian laser  
beam are  
employed to create  
donut and center  
bubbles in the  
plasma, resp.

FIG. 1. The concept of the positron ballistic injection scheme. The blue and green colors are contour surfaces of electron densities of donut and center bubbles, respectively. The red color represents injected positrons. The  $x$ - $y$  and  $x$ - $z$  planes are transverse slices of the density distribution and the longitudinal electric field  $E_x$ . The red curve in the  $x$ - $y$  plane is the trajectory of an injected positron (corresponding to the projection of red balls in the 3D model). The leading oscillating colors (amber and grey) denote the laser beams in the  $x$ - $z$  plane. The  $y$ - $z$  plane is the projection of electron density (blue) and injected positron density (red).

# Muon Collider

$\sim 1.6 \times 10^9$  x less SR than  $e^+e^-$ , no beamstrahlung problem  
 two production schemes proposed

US-MAP (2015)  $p$ -driven

key challenges

$\sim 10^{13}$ - $10^{14}$   $\mu$  / sec tertiary particle  $p \rightarrow \pi \rightarrow \mu$ :

fast cooling ( $\tau=2\mu\text{s}$ ) by  $10^6$  (6D)

fast acceleration mitigating  $\mu$  decay

background from  $\mu$  decay

$\mu$ 's decay within a few 100 - 1000 turns:

→ rapid acceleration

(perhaps plasma?)

→  $\nu$  radiation hazard

(limits maximum  $\mu$  energy)

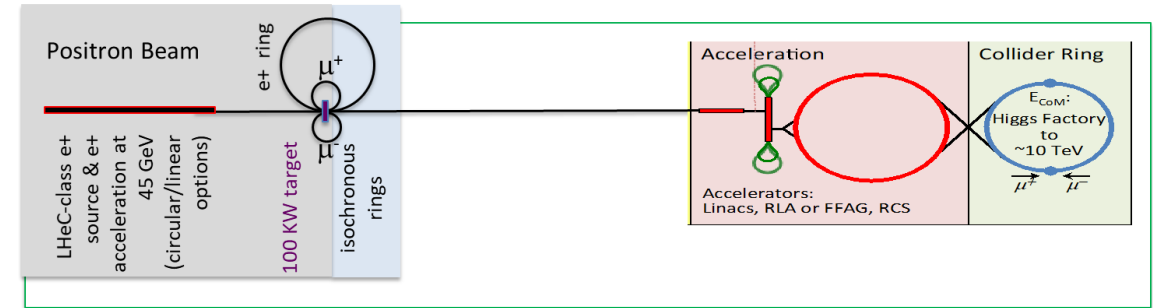

Bruce King 1999

$\sigma_\nu \propto E$ , flux  $\propto E^2$  (Lorentz boost)

solution beyond 10 TeV unclear

Italian LEMMA (2017)  $e^+$ -annihilation

key challenges

$\sim 10^{11}$   $\mu$  / sec from  $e^+e^- \rightarrow \mu^+\mu^-$

key R&D

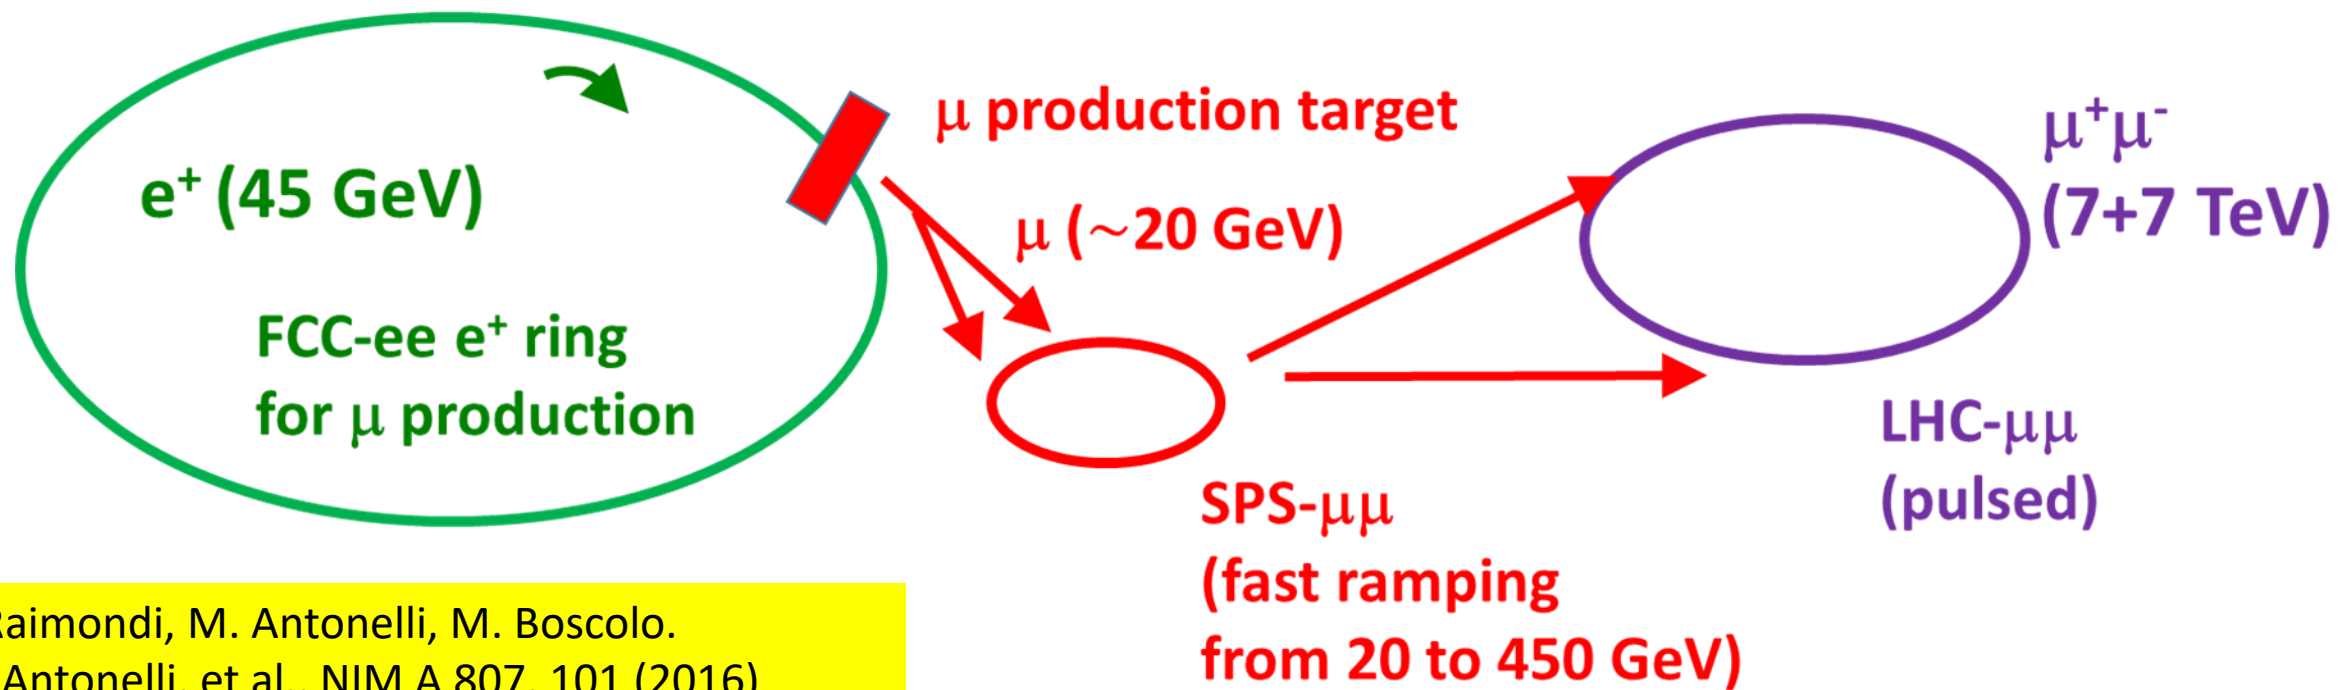

$10^{15}$   $e^+$ /sec, 100 kW class target, NON destructive process in  $e^+$  ring

needs large 45 GeV  $e^+$  ring like FCC-ee, possible upgrade path to FCC- $\mu\mu$

## 14 TeV $\mu$ collider LHC- $\mu\mu$ with FCC-ee $\mu^\pm$ production

P. Raimondi, M. Antonelli, M. Boscolo.  
M. Antonelli, et al., NIM A 807, 101 (2016)  
M. Boscolo et al., PRAB 23, 051001 (2020)

# after FCC-hh: FCC- $\mu\mu$ , a 100 TeV $\mu$ collider?

# Energy Recovery Linacs (ERLs) – Landscape

V. Litvinenko, T. Roser, M. Chamizo

test Facility PERLE at IJCLab  
 (high current, multi-turn)  
 would complement MESA, CBETA,  
 bERLinPRO and EIC cooler

M. Klein

ERL Panel

# Possible Future Colliders based on ERLs

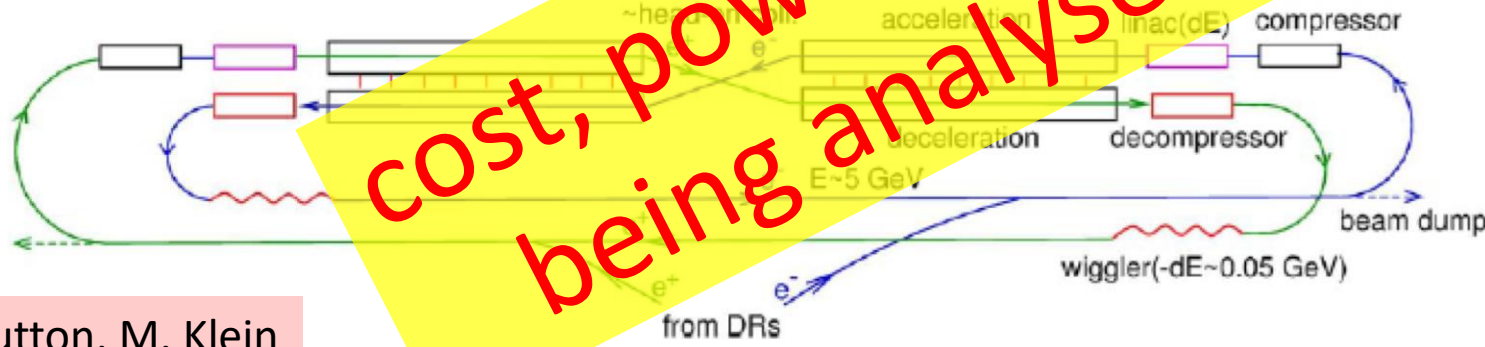

## Energy Frontier Collider Applications of Energy Recovery Linacs

$\sqrt{s_{ep}} = 1-4 \text{ TeV}$   
 $L(\text{HERA}) \times 1000$   
 (ERL and LHC)  
 1206.2913, JPhysG  
 2007.14491, JPhysG  
 $f=802\text{Mz}$ ,  
 3+3 passes: 20 MV/m,  $Q_0 > 10^{10}$   
 20 MV/m,  $Q_0 > 10^{10}$

**ERLC ILC as ERL**  
 V. Telnov at LCWS → arXiv:2105.11015  
 $L(\text{ERLC}) \sim 10^{36} = O(100) \text{ std } L(\text{ILC})$   
 This yields  $O(10^7) \text{ HZ events in 3 years.}$   
 1+1 passes,  $l=160\text{m}$   
 $f=750 \text{ MHz}$ ,  $20 \text{ MV/m}$ ,  $Q_0 > 10^{10}$

cost, power & feasibility of ERLC & CERC  
 being analysed by expert sub-panel

# reappraisal of historical ERL proposals

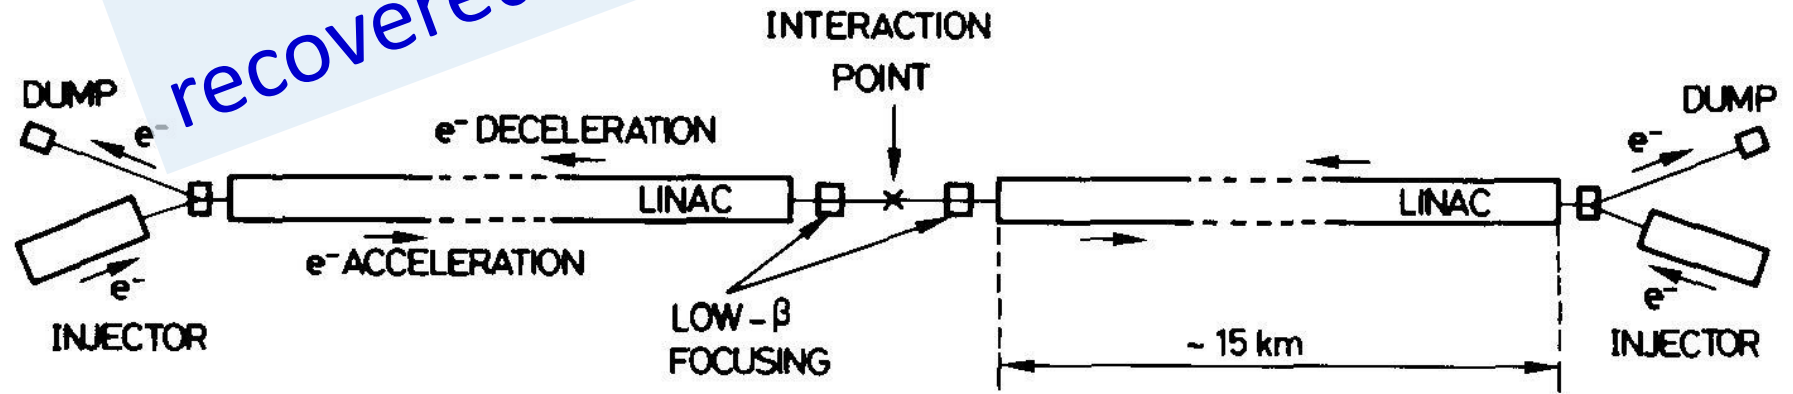

early linear-collider proposals

1-6 GeV c.m.

Maury Tigner, "A Possible Apparatus for Clashing-Beam Experiments", *Nuovo Cimento* 37, 1228 (1965)

Ugo Amaldi, "A possible scheme to obtain  $e^-e^-$  and  $e^+e^-$  collisions at energies of hundreds of GeV", *Physics Letters* B61, 313 (1976)

300 GeV c.m.

these early proposal always recovered the energy of the spent beam!

# comparison of ERL collider proposals then and now

	Tigner 1965	Amaldi 1976	Gerke – Steffen 1979	Litvinenko-Roser- Chamizo 2019		Telnov 2021	
c.m. energy [GeV]	1-6	300	200	240	600	250	500
average beam current [mA]	120	10	0.3	2.5	0.16	100	100
vertical rms IP beam size [nm]	40,000 (round)	2,000 (round)	900 (round)	6	5	6.1	7.4
luminosity [ $10^{34} \text{ cm}^{-2}\text{s}^{-1}$ ]	0.0003	0.01	0.004	73	8	90	64

**Main differences: flat instead of round beams, much smaller (vertical) beam sizes, higher beam current → ~10,000x higher luminosity**

# ESPP Update 2020 “Major Developments from 2013” - 1

- ... a significantly enhanced physics potential is expected with the HL-LHC. The **required high-field superconducting Nb<sub>3</sub>Sn magnets have been developed**. The **successful completion of the high-luminosity upgrade of the machine** and detectors should remain the focal point of European particle physics, together with continued innovation in experimental techniques. The full physics potential of the LHC and the HL-LHC, including the study of flavour physics and the quark-gluon plasma, should be exploited.

# LHC & HL-LHC

~1.2 km of accelerator will be upgraded

# ESPP Update 2020 “Major Developments from 2013” - 2

- Europe, and CERN through the **Neutrino Platform**, should **continue to support long baseline experiments in Japan and the United States**. In particular, they should continue to collaborate with the United States and other international partners towards the successful implementation of the Long-Baseline Neutrino Facility (LBNF) and the Deep Underground Neutrino Experiment (DUNE).

# super-beam facilities & upgrades

Fermilab & J-PARC Power Upgrades

protons per pulse challenge

V. Shiltsev

power efficiency challenge

J-PARC : 0.5 MW beams vs ~40 MW site power
