

# ALICE proposal for MasterClass based on visual identification of strange particles in pp LHC data

work by

**P. Debski**, D. Hatzifotiadou, B. Hipolyte,  
A. Maire, M. Tadel,

P. Foka  
GSI, Darmstadt

EPPOG, Oslo  
15 April 2010

# Contents

## Basic idea

-variants

## First implementation

- prototype exercise, web page, accompanying material

## Data samples

- real collisions (and MC data) in pp and later in PbPb

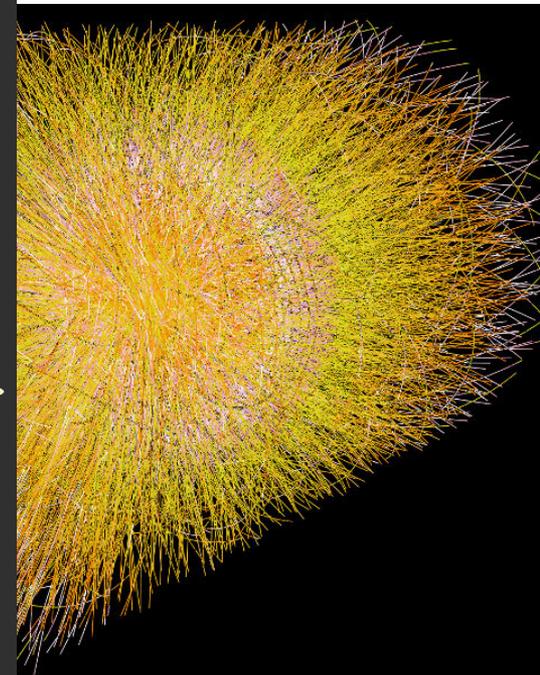

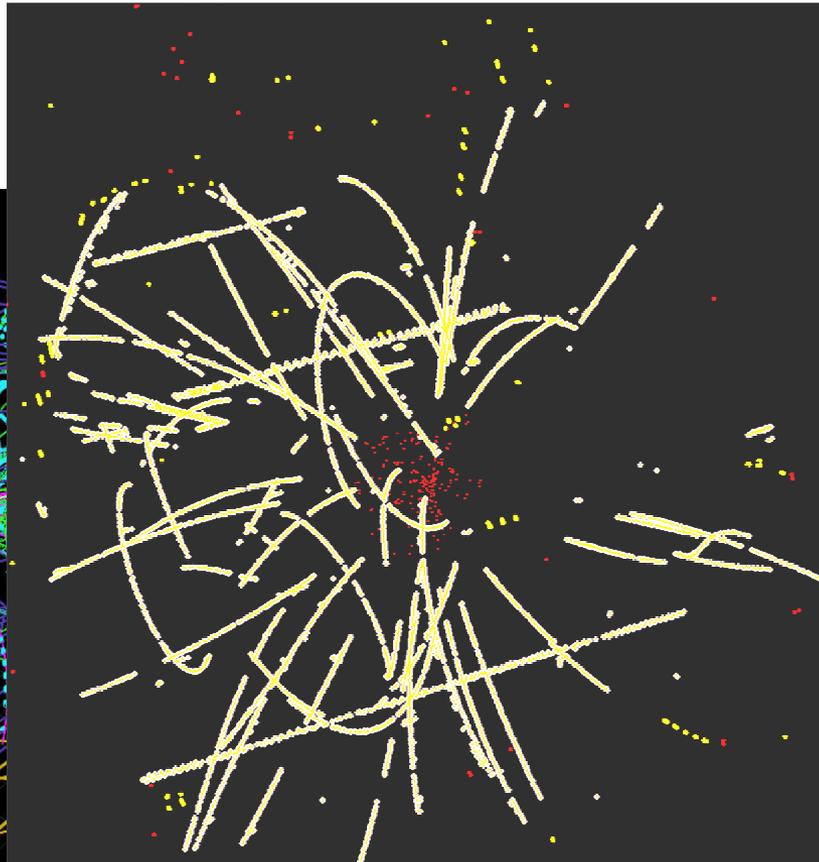

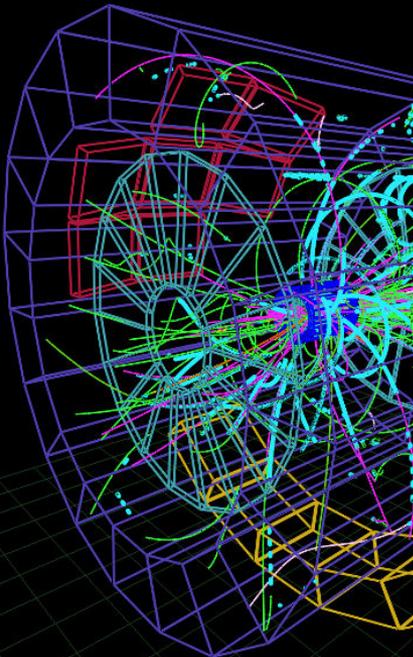

## Tools

“Pilot” tests

ToDo Lists

Proposals and ideas  
for discussion

Start with pp  
go to PbPb

# Basic idea

**Identify strange particles through their decay pattern  
using visualisation tools**

**Measurement: count n. of different species of strange particles**

## **Aim: Variant A**

Count strange particles, compare to MC

## **Aim: Variant B**

**Count strange particles, make ratios: strange/non-strange particles**

**Check QGP signature (strangeness enhancement)**

## **Aim: Variant C and D (for uni level)**

Count strange particles, make ratios of different particles

Measure characteristics of phase transition

To Be Given

n. of non-strange particles in real and MC data

**Works for  
pp and PbPb**

# Cascade topology reconstruction in PbPb

Tracking challenge but it works!!

MC PbPb event

Cascade:  $\Xi, \Omega$

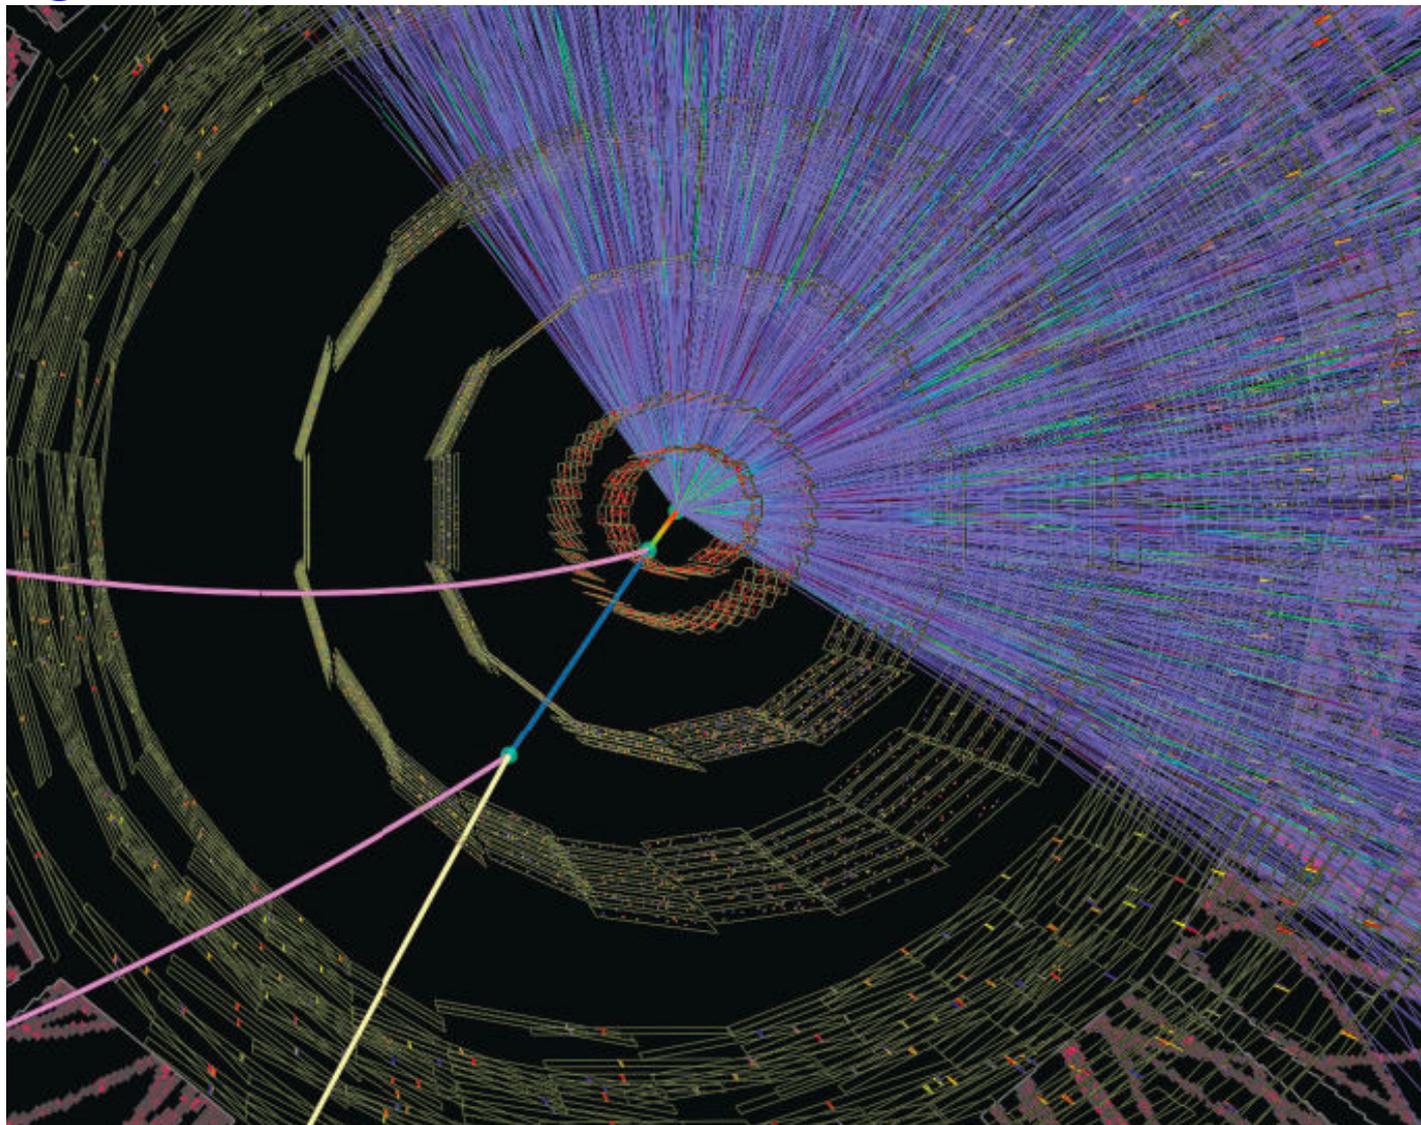

with part of the  
event removed  
displaced  
vertices can be  
seen

$10^7$  events:

$p_t$  reach  $\Xi, \Omega$

$\sim 9-12$  GeV

by M. Tadel and A. Tadel

# Basic idea

Identify strange particles through their decay pattern  
using visualisation tools

Measurement: count n. of different species of strange particles

## Aim: Variant A

Count strange particles

Compare measured counts (“yield”) to MC (Pythia)

Correctness of MC  
underlying event

Outcome: strangeness production; confirm or not the MC

## Example of reporting table

possibility to measure  
in MC too or give  
pre-calculated values

Particle species	Real	Pythia
$K^0$	measured	given (or measured)
$\Lambda$ (anti $\Lambda$ )	measured	given (or measured)
$\Xi$	measured	given (or measured)
$\pi$	given	given
Nch	given	given

# Basic idea

Identify strange particles through their decay pattern using visualisation tools

Measurement: count n. of different species of strange particles

## Aim: Variant B

Count strange particles, get n. of non-strange particles  
make ratios: strange/non-strange particles

Compare ratios in real pp data and reference (Pythia, or pp low multiplicity)

Outcome: confirm or not strangeness enhancement (predicted as QGP)

Discovery potential  
QGP-like pattern  
in (high multiplicity) pp

particle species	real	Pythia	Ratio strange/ $\pi$	real	Pythia
$K^0$	measured	given	$K^0 / \pi$	deduced	given
$\Lambda$	measured	given	$\Lambda / \pi$	deduced	given
$\Xi$	measured	given	$\Xi / \pi$	deduced	given
$\pi$	given	given			
Nch	given	given			

Ratio of total strange to non-strange (proper normalisation)

# Basic idea

**Identify strange particles through their decay pattern  
using visualisation tools**

**Measurement: count n. of different species of strange particles**

**for university level**

**First physics  
PRL in 900 GeV  
from ALICE**

## **Aim: Variant C**

Count strange particles and make ratio:  $\Lambda$  /  $\text{anti}\Lambda$

**Outcome: Baryon-antibaryon asymmetry : baryon transfer mechanism**

## **Aim: Variant D**

Count strange particles, get n. of non-strange and make ratios of different particles

Give the ratios as input to chemical models

**Outcome: characteristics of phase transition:  $\mu$  and T  
(baryon density, Temperature)**

**Nail down properties  
of hadronisation**

# First implementation

## ● Introduction

- ⇒ QGP physics, strangeness as signature
- ⇒ Experiment
- ⇒ Detector principle
- ⇒ From signal recording to visualisation
- ⇒ Tracking and PID ( $\pi$ ,  $K$ ,  $p$ )
- ⇒ Strange particles decay patterns ( $K^0$ ,  $\Lambda$ ,  $\Xi$ ,)

## ● Exercise

- ⇒ Examples of decay patterns and kinematical characteristics
- ⇒ Demo, “guided tour”
- ⇒ On your-self

**data samples: 100 real pp per student**  
**possibility that half of the class has**  
**real and half MC data**  
**without telling them in advance ??**

## ● Individual measurements

- ⇒ Students work on their data sample: identify, count and report

## ● Analysis by the class

- ⇒ Teacher collects individual reports: data analysis, conclusions (ToBe Done)

# First implementation

## ● Visualisation tools and functionality of AliEVE V0

Implemented by A. Maire and B. Hipollyte, simplified by P. Debski

- ⇒ From AliRoot to ROOT
- ⇒ Experiment independent
- ⇒ No need of heavy installation
- ⇒ Runs in PC and mac laptop

## ● Needed files

- ⇒ VizDB with geometry and reconstructed objects definitions
- ⇒ Xi.root with the data of strange particle candidates

# Support material

## ● Web page and animations (version 0)

⇒ QGP physics, strangeness as signature

Text and simplified slides

**animation of heavy-ion collision**

⇒ Experiment

Text, experimental set up and photos

**animation of the experiment and detectors**

**animation of collision in the centre of experiment**

**and particle propagation in the detectors**

⇒ Detector (emphasis on TPC)

**animation for TPC principle of operation**

⇒ From signal recording to visualisation

**animations of events 900 GeV and 7 TeV pp**

⇒ Tracking strategy and Strange particles decay patterns ( $\pi$ ,  $K$ ,  $p$ ), ( $K^0$ ,  $\Lambda$ ,  $\Xi$ ),

**views of V0s and Cascades in 900 GeV and 7 TeV pp**

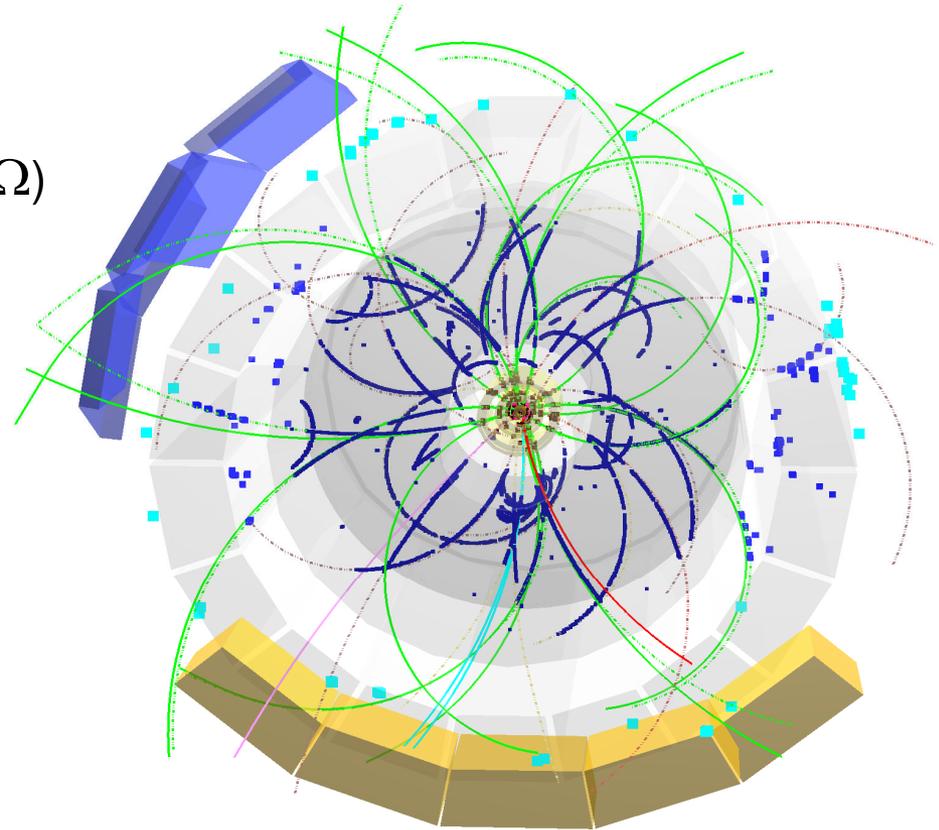

QuickTime™ and a  
Cinatra decompressor  
are needed to see this picture.

**use of visualisation  
in every day life**

# Data samples

- Some 10ths of  $V_0$ s and  $\Xi$  in pp at 900 GeV and 7 TeV
  - ⇒ Used for demo of prototype and web
- Existing lists of good  $V_0$ s and  $\Xi$  in pp at 900 GeV
  - ⇒ Used for strangeness production paper  
(200  $\Xi$  in 500 K pp at 900 GeV)
- Existing lists of  $\Xi$  and  $\Omega$  at 7 TeV
  - ⇒ Analysis in progress ( $\sim 1000$   $\Xi$ ,  $\sim 70$   $\Omega$ )

**We have enough real pp data to prepare data samples**

# Data samples

**ToDo:** (in July)

“automatise” the method to extract

from **real and MC pp data**

the necessary sub-samples

from which to create input data

for the MasterClass

QuickTime™ and a  
Oregain decompressor  
are needed to see this picture.

● **Sub-samples: filter out of data the run, event, topology ID numbers**

⇒ of “**golden**” candidates (preliminary version)

⇒ of “**bad**” candidates which failed geometrical criteria

⇒ of events with **no strange** particle candidates

● **Mix them to create input file to MasterClass**

⇒ Students should not wait for ever to find a  $\Xi$  (200  $\Xi$  in 500 K in 900 GeV)

⇒ **Mixing should preserve the observed in reality strange/non-strange ratios**  
**(i.e. no artificial strangeness enhancement)**

# Expose to real life tests

## ToDo:

### 1. Pilot MasterClass

(CERN training centre; September)

### 2. Scrutiny test by “alternative teaching” teachers

(laptop demo; Greece June)

### 3. University exercise (Warsaw univ; October)

## Aim:

### 1. Realise the “holes” (what we assume and we need to explain)

### 2. ...what is too complex, what is boring....

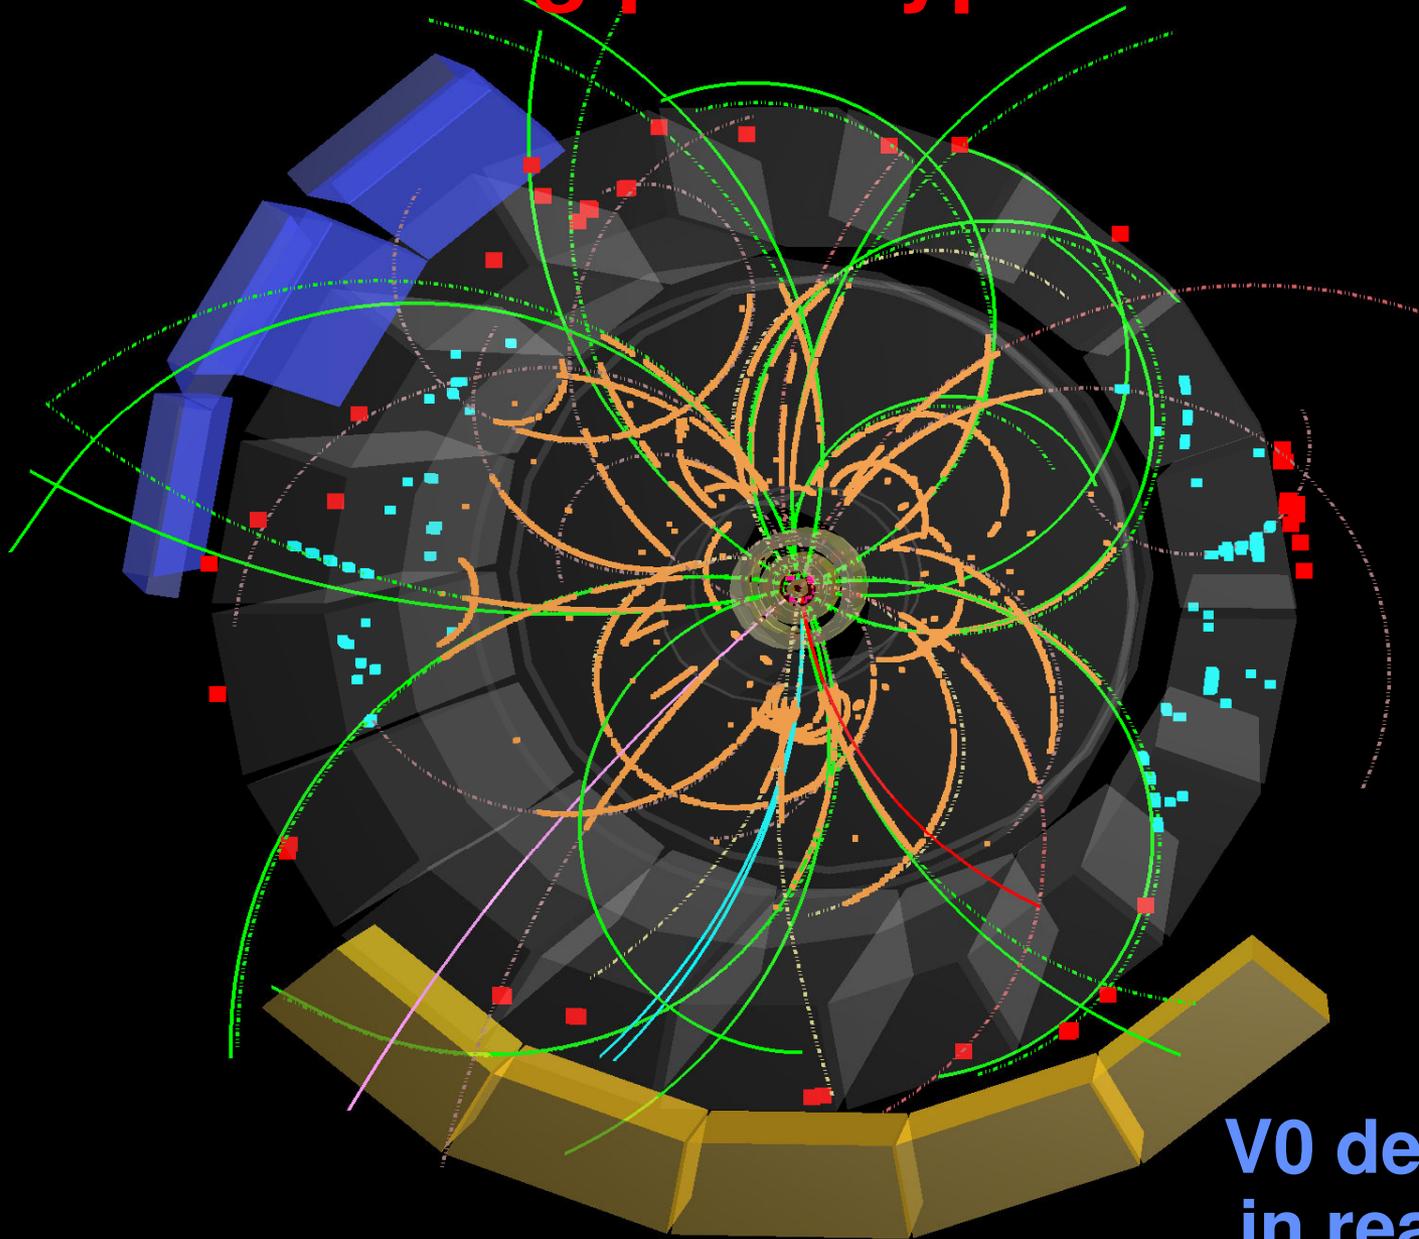

### ● Given feedback, advices, to keep in mind, to consider....

⇒ Start from more complete (complex), reduce and simplify on the way

⇒ Students that participate are by default interested and of certain level?

⇒ Different level at different countries?.... What else...

# Existing prototype

V0 decay pattern  
in real pp events

# Existing prototype

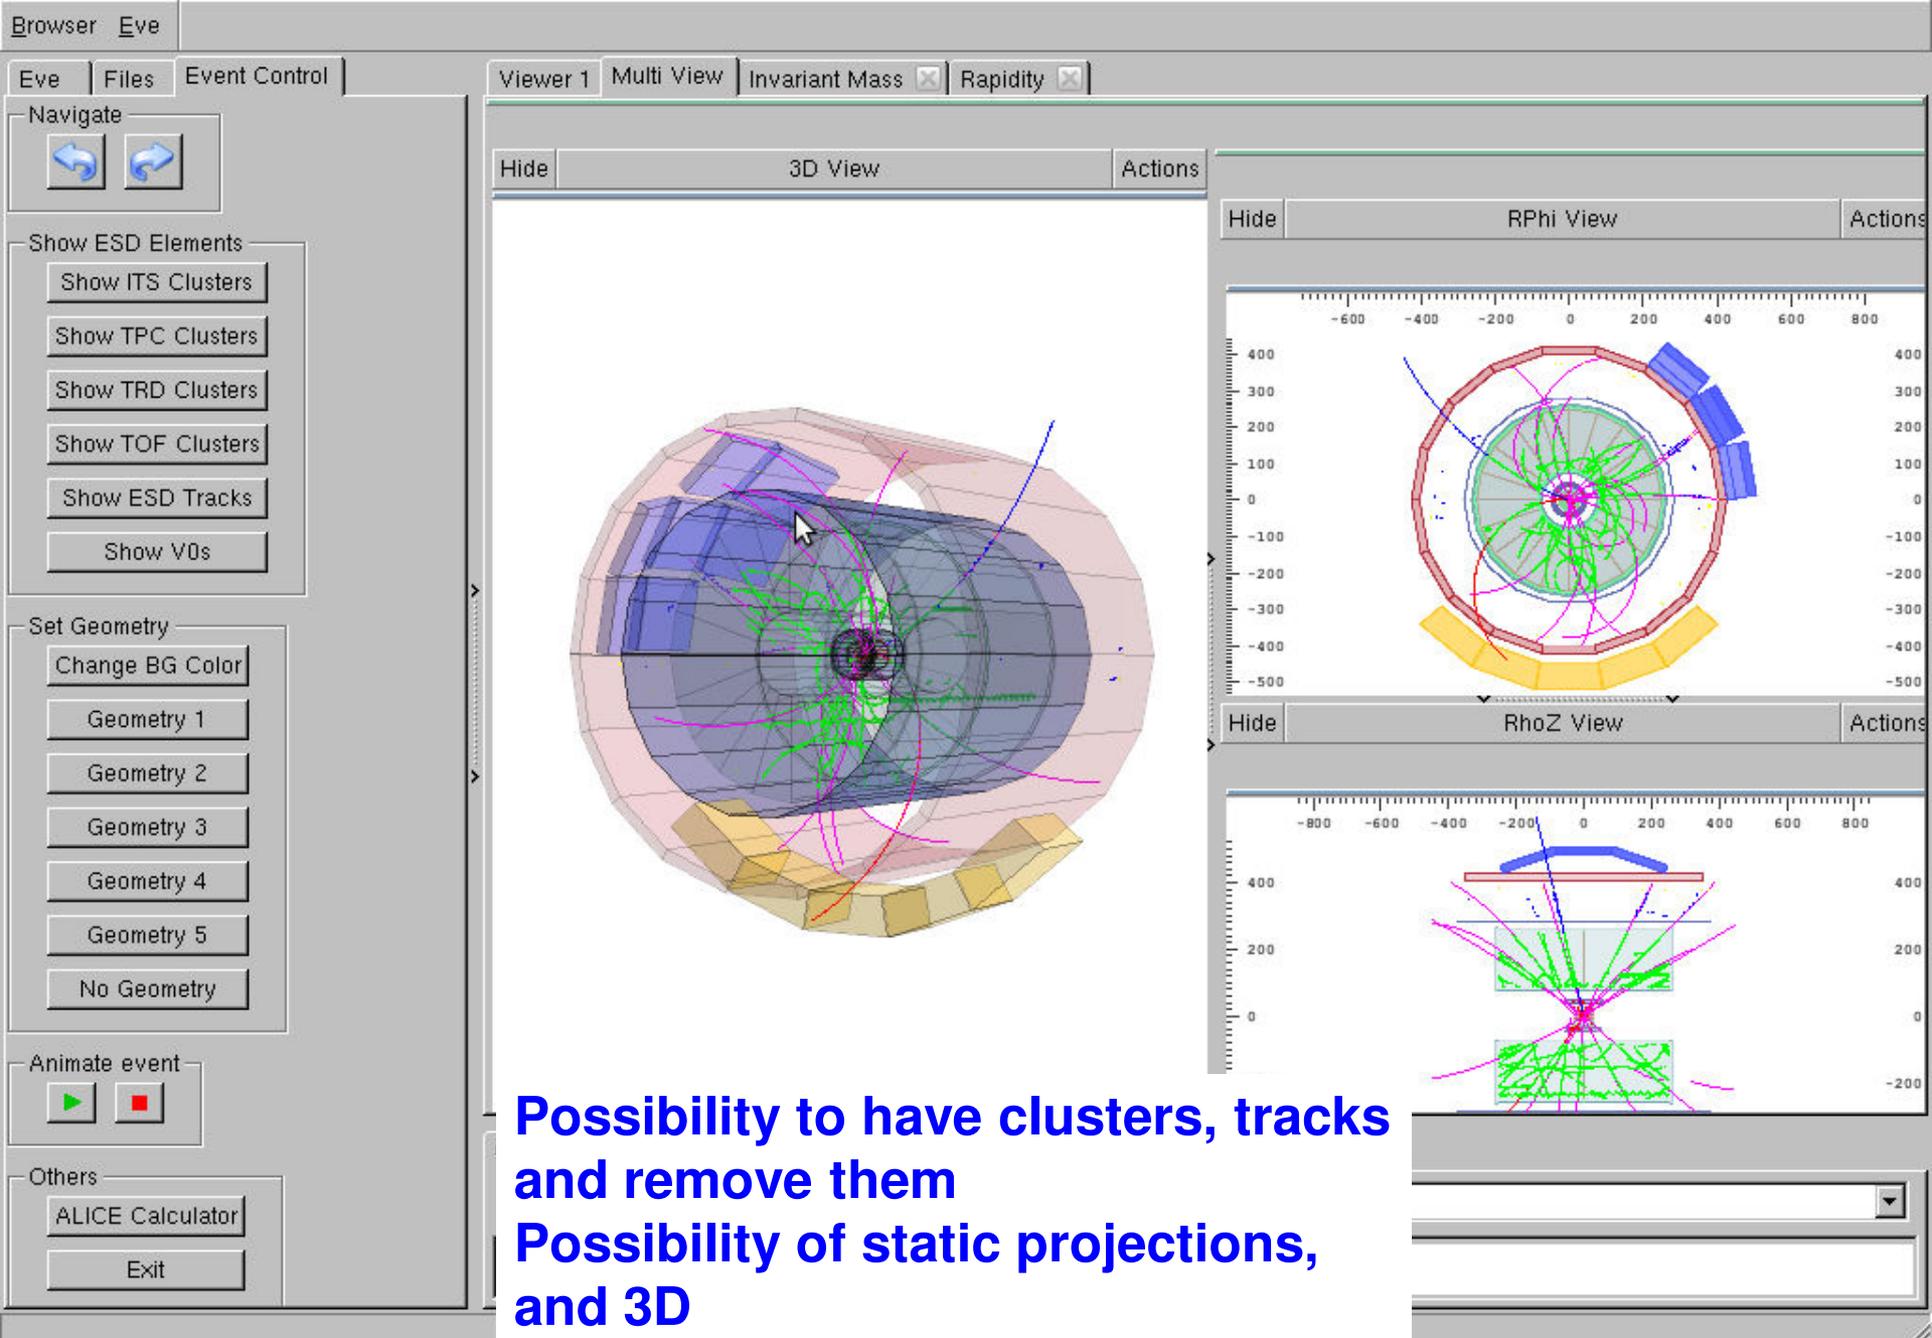

The screenshot displays the ALICE Calculator software interface. At the top left, there are dropdown menus for 'Chapters' (set to 'Chapter 1') and 'Parts' (set to 'Example 1'), along with 'Start' and 'Exit' buttons. The main window is titled 'ALICE Calculator' and contains several panels:

- Particle Table:** A table listing particle types and their masses in  $\text{GeV}/c^2$ .
- Calculator:** Input fields for the 1st and 2nd particles' momentum components (px, py, pz) and mass, along with buttons for 'Rapidity', 'Invariant Mass', and particle identification ('That's Lambda!', 'That's Anti-Lambda!', 'That's Kaon!', 'That's Xii', 'Save', 'Exit').
- Browser:** A panel with 'Eve' and 'Files' tabs, 'Event Control' buttons, and 'Show ESD Elements' options (ITS Clusters, TPC Clusters, TRD Clusters, TOF Clusters, ESD Tracks, V0s).
- Set Geometry:** Buttons for 'Geometry 1' through 'Geometry 5' and 'No Geometry'.
- Animate event:** Play and stop buttons.
- Others:** 'ALICE Calculator' and 'Exit' buttons.

Two floating windows, '(-) Part' and '(+) Part', are open, showing momentum components (X, Y, Z) and mass for two particles. Each window has a 'Copy to calculator' button with a red 'X' over it. A red arrow points from the 'Copy to calculator' button in the '(+) Part' window to the 'Calculator' panel. A blue arrow points from the 'Copy to calculator' button in the '(-) Part' window to the 'Calculator' panel.

On the right side, there are two event visualization plots: 'RPhi View' and 'RhoZ View'. The 'RPhi View' plot shows a blue line and a red curve. The 'RhoZ View' plot shows a blue line and a red arrow. A red arrow points from the '(+) Part' window to the 'RhoZ View' plot.

The bottom status bar shows the user 'pdebski@pdebski-lap...' and several open windows: 'Eve Main Window', 'ALICE Calculator', '(-) Particle', and '(+) Particle'.

**Possibility to have clusters, tracks and remove them**  
**Possibility of static projections, and 3D**

**The ALICE Experiment**

ALICE is the acronym for A Large Ion Collider Experiment, one of the largest experiments in the world devoted to research in the physics of matter at an infinitely small scale. Hosted at CERN, the European Laboratory for Nuclear Research, this project involves an international collaboration of more than 1000 physicists, engineers and technicians, including around 200 graduate students, from 105 physics institutes in 30 countries across the world.

**The detector**

Weighting 10 000 tones and with a height of 16 m and a length of 26 m, ALICE is a large and complex detector composed of 18 sub-detectors to track and identify the tens of thousands of particles produced in each heavy-ion collision. To record up to 8000 collisions per second, the ALICE detector is based on state-of-the-art technologies:

- high precision systems for detecting and tracking the particles;
- ultra miniaturized systems for processing electronics signals;
- a worldwide distribution of computing resources for data analysis (the Grid).

## Physics in ALICE

ALICE is going in search of answers to the questions:

- What happens to matter when it is heated to 100,000 times the temperature at the centre of the Sun ?
- Why do protons and neutrons weigh 100 times more than the quarks they are made of ?
- Can the quarks inside the protons and neutrons be freed ?

ALICE is the acronym for A Large Ion Collider Experiment, one of the largest experiments in the world devoted to research in the physics of matter at an infinitely small scale. Hosted at CERN, the European Laboratory for Nuclear Research, this project involves an international collaboration of more than 1000 physicists, engineers and technicians, including around 200 graduate students, from 105 physics institutes in 30 countries across the world. The ALICE Experiment is going in search of answers to fundamental questions, using the extraordinary tools provided by the LHC: using the extraordinary tools provided by the LHC

- Confinement

## The strong interaction

Ordinary matter is made of atoms, each of which consists of a nucleus surrounded by a cloud of electrons. Nuclei are made of protons and neutrons, which in turn are made of quarks. As far as we know today, the quarks seem to be elementary constituents. Quarks are bound together into protons and neutrons by a force known as the strong interaction, mediated by the exchange of force carrier particles called gluons. The strong interaction is also responsible for binding together the protons and neutrons inside the atomic nuclei. Although much of the physics of strong interaction is today well understood, two very basic issues remain unresolved: the origin of confinement and the mechanism of the generation of mass. Both are thought to arise from the way the properties of the vacuum are modified by the strong interaction.

- [Back to the beginning](#)

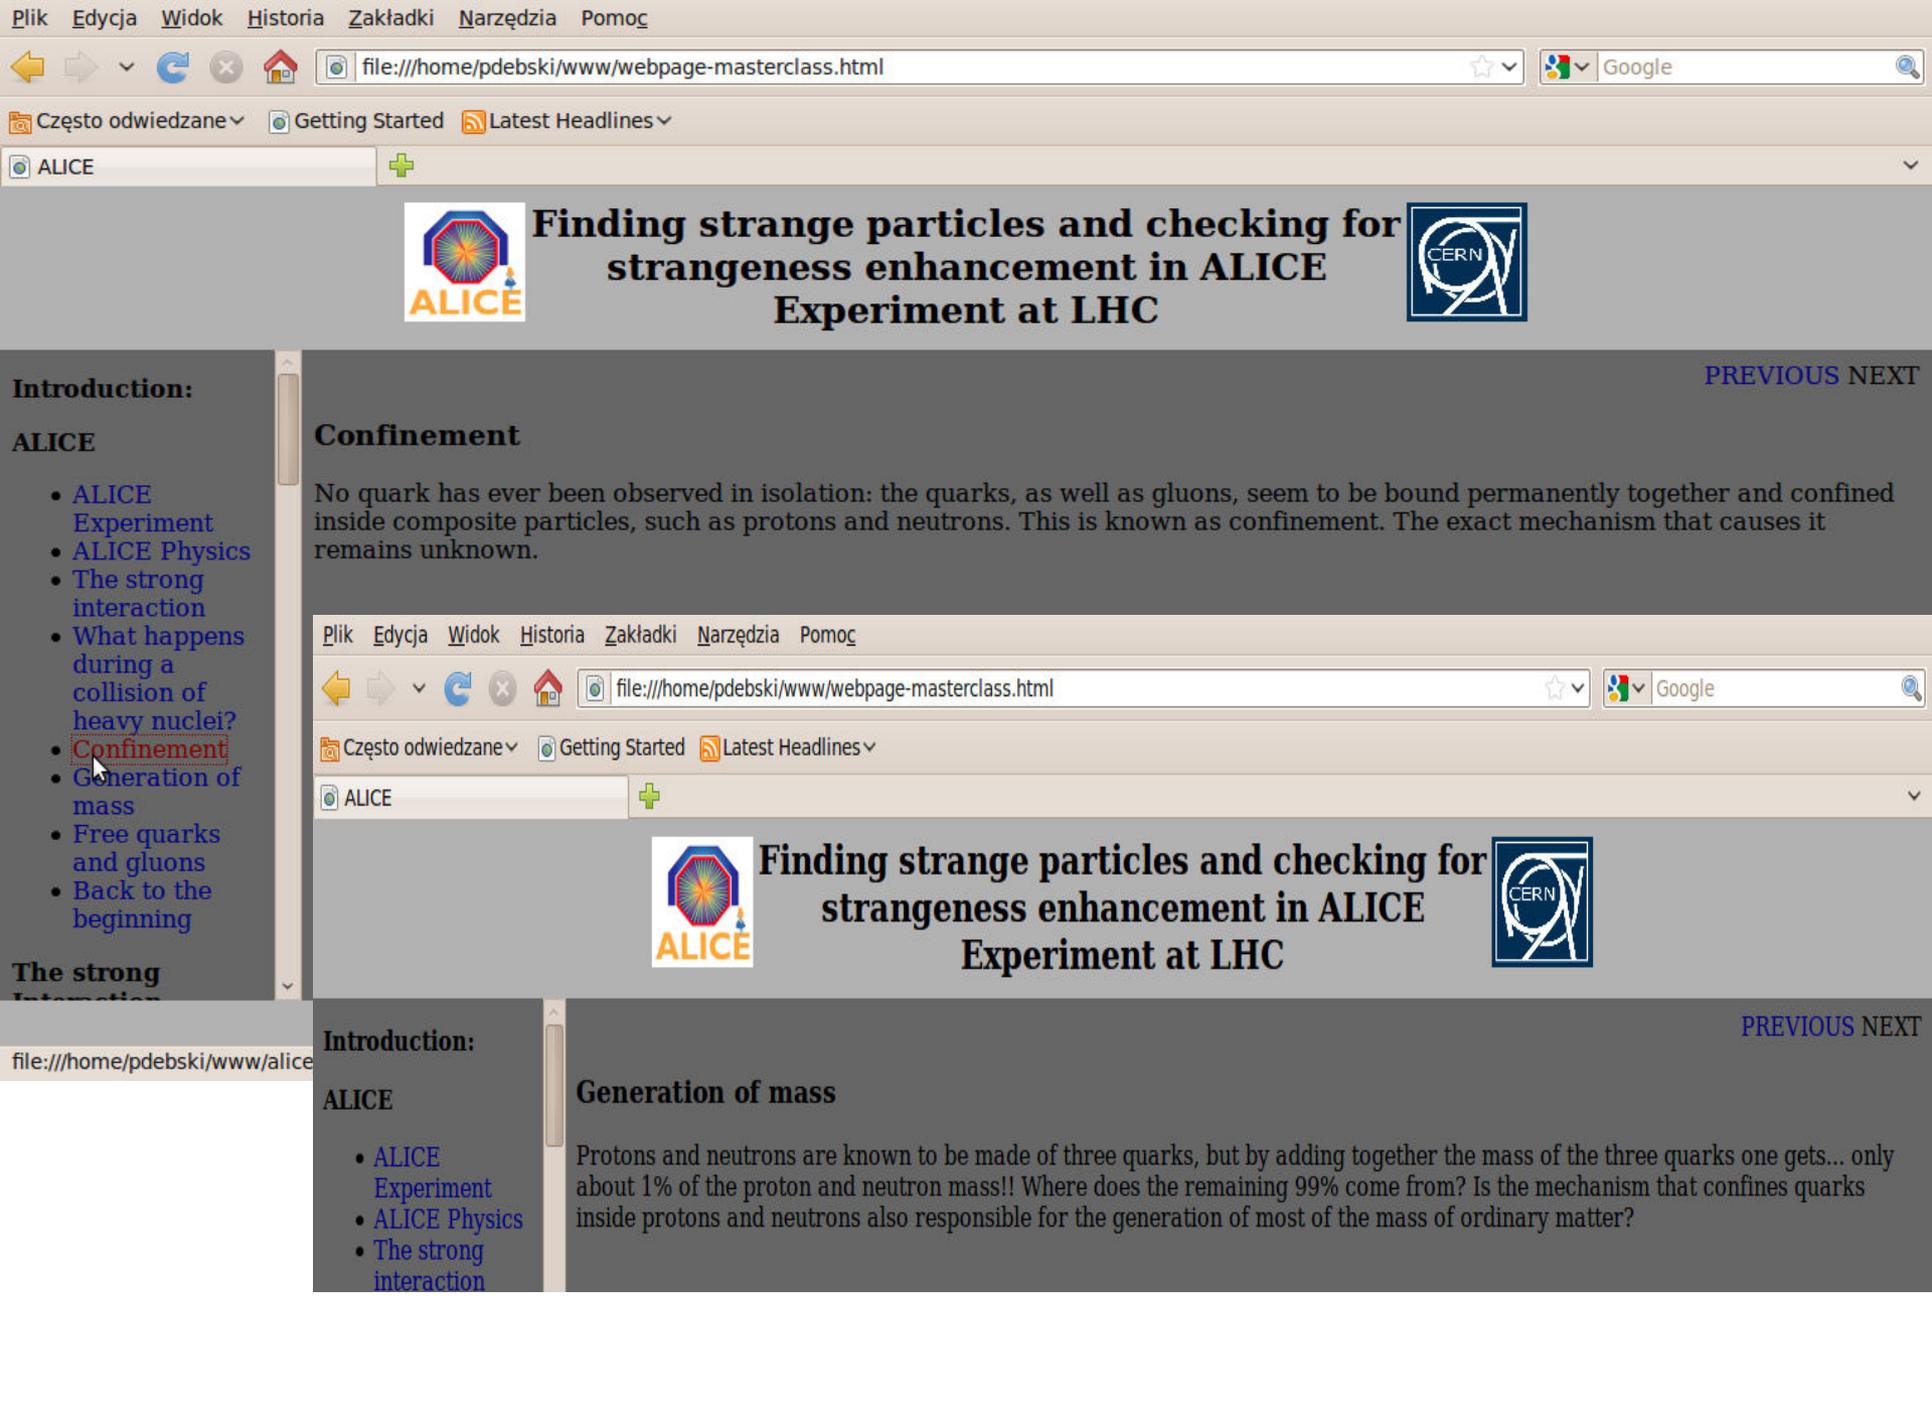

## What happens during a collision of heavy nuclei?

The two heavy nuclei approach each other at a speed close to that of light. According to Einstein's theory of relativity, they appear as very thin disks. The two nuclei collide and the extreme temperature that is generated during the collision releases the quarks (red, blue and green) and gluons. Quarks and gluons collide with each other creating a thermally equilibrated environment: the quark-gluon plasma. The plasma expands and cools down to the temperature (10 to 12 degrees) at which quarks and gluons regroup to form ordinary matter, barely 10 to -23 seconds after the start of the collision. The thousands of new particles created in this way move towards the detection system. (simulation)

- [The strong interaction](#)
- [What happens during a collision of heavy nuclei?](#)
- [Confinement](#)
- [Generation of mass](#)
- [Free quarks and gluons](#)
- [Back to the beginning](#)

### The strong interaction

## Confinement

No quark has ever been observed in isolation: the quarks, as well as gluons, seem to be bound permanently together and confined inside composite particles, such as protons and neutrons. This is known as confinement. The exact mechanism that causes it remains unknown.

# Finding strange particles and checking for strangeness enhancement in ALICE Experiment at LHC

[PREVIOUS](#) [NEXT](#)

## Introduction:

### ALICE

- [ALICE Experiment](#)
- [ALICE Physics](#)
- [The strong interaction](#)

## Generation of mass

Protons and neutrons are known to be made of three quarks, but by adding together the mass of the three quarks one gets... only about 1% of the proton and neutron mass!! Where does the remaining 99% come from? Is the mechanism that confines quarks inside protons and neutrons also responsible for the generation of most of the mass of ordinary matter?

- Introduction:**
- ALICE**
- [ALICE Experiment](#)
  - [ALICE Physics](#)
  - [The strong interaction](#)
  - [What happens during a](#)

## Free quarks and gluons

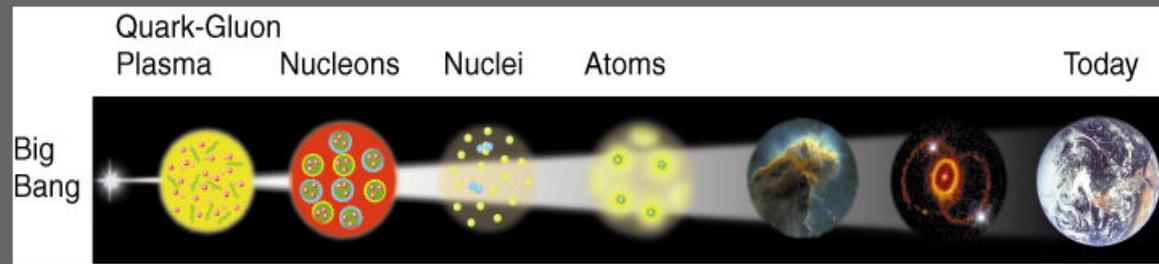

The current theory of the strong interaction (called quantum chromodynamics QCD) predicts that at very high temperatures and very high densities, quarks and gluons should no longer be confined inside composite particles. Instead they should exist freely in a new state of matter known as quark-gluon plasma. Such a transition should occur when the temperature exceeds a critical value estimated to be around 2000 billion degrees.... about 100 000 times hotter than the core of the Sun!! Such temperatures have not existed in Nature since the birth of the Universe. We believe that for a few millionths of a second after the Big Bang the temperature was indeed above the critical value, and the entire universe was in a quark-gluon plasma state.

  - [Confinement](#)
  - [Generation of mass](#)
  - [Free quarks and gluons](#)
  - [Back to the beginning](#)
- The strong interaction**

## Back to the beginning

Can this scenario be studied experimentally? Can such extreme conditions be recreated in the laboratory? By inducing head-on collisions of heavy nuclei (such as nuclei of lead atoms) accelerated by the LHC to a speed close to the speed of light, we should be able to obtain -albeit over a tiny volume, only about the size of a nucleus- and for an exceedingly short instant, a drop of such primordial matter and observe it as it reverts to ordinary matter through expansion and cooling. By studying such collisions at the LHC, ALICE should be able to explore deep into the physics of confinement, to probe the properties of the vacuum and the generation of mass in strong interactions- and to get a glimpse of how matter behaved immediately after the Big Bang.

## Chapter 2:

### Decay patterns from MC/REAL data

- Decay patterns from MC/REAL data

## Chapter 3:

### Decay patterns of strange particles

Here there the decay patterns of strange particles will be presented, kinematical variables (not only the formulas, but invariant mass plot also) and different decays; *symmetric* neutral kaons and gammas, *assymetric* lambdas and anti-lambdas; also explain the role of PID for example for symmetric decays look if the daughters are pions or electrons. Also, explain the particle - antiparticle difference. Explain the cascade pattern  $\xi \rightarrow \lambda + \pi$ , and then  $\lambda \rightarrow p + \pi$ .

# K from kinks

*K - kinks*

*K*  $\rightarrow$   $\pi\pi^0$  21.13%

*$\pi$  - kinks*

*$\pi$*   $\rightarrow$   $\mu\nu$  99%

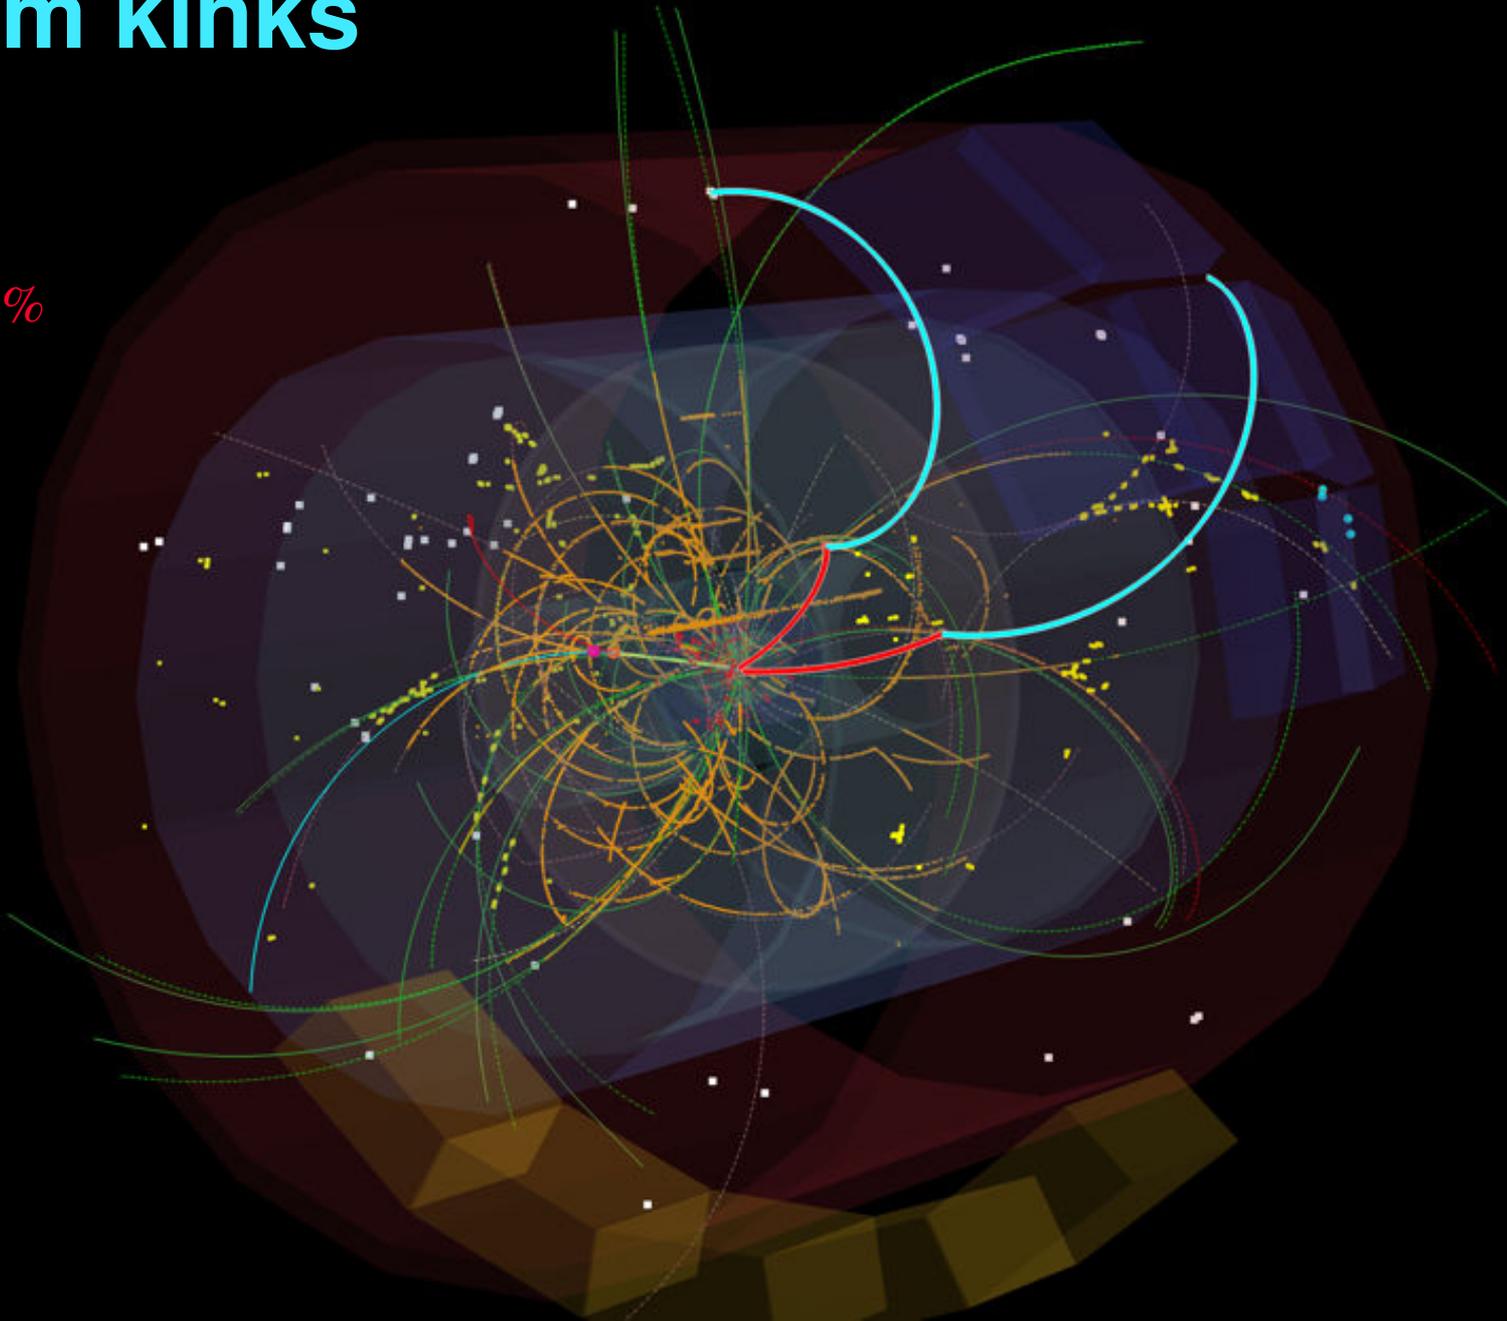

*K decays*

*K*  $\rightarrow$   $\mu\nu$  63.43%

*K*  $\rightarrow$   $\varepsilon\pi^0\nu$  4.87%

*K*  $\rightarrow$   $\mu\pi^0\nu$  3.27%

*K*  $\rightarrow$   $\pi\pi^0\pi^0$  1.73%

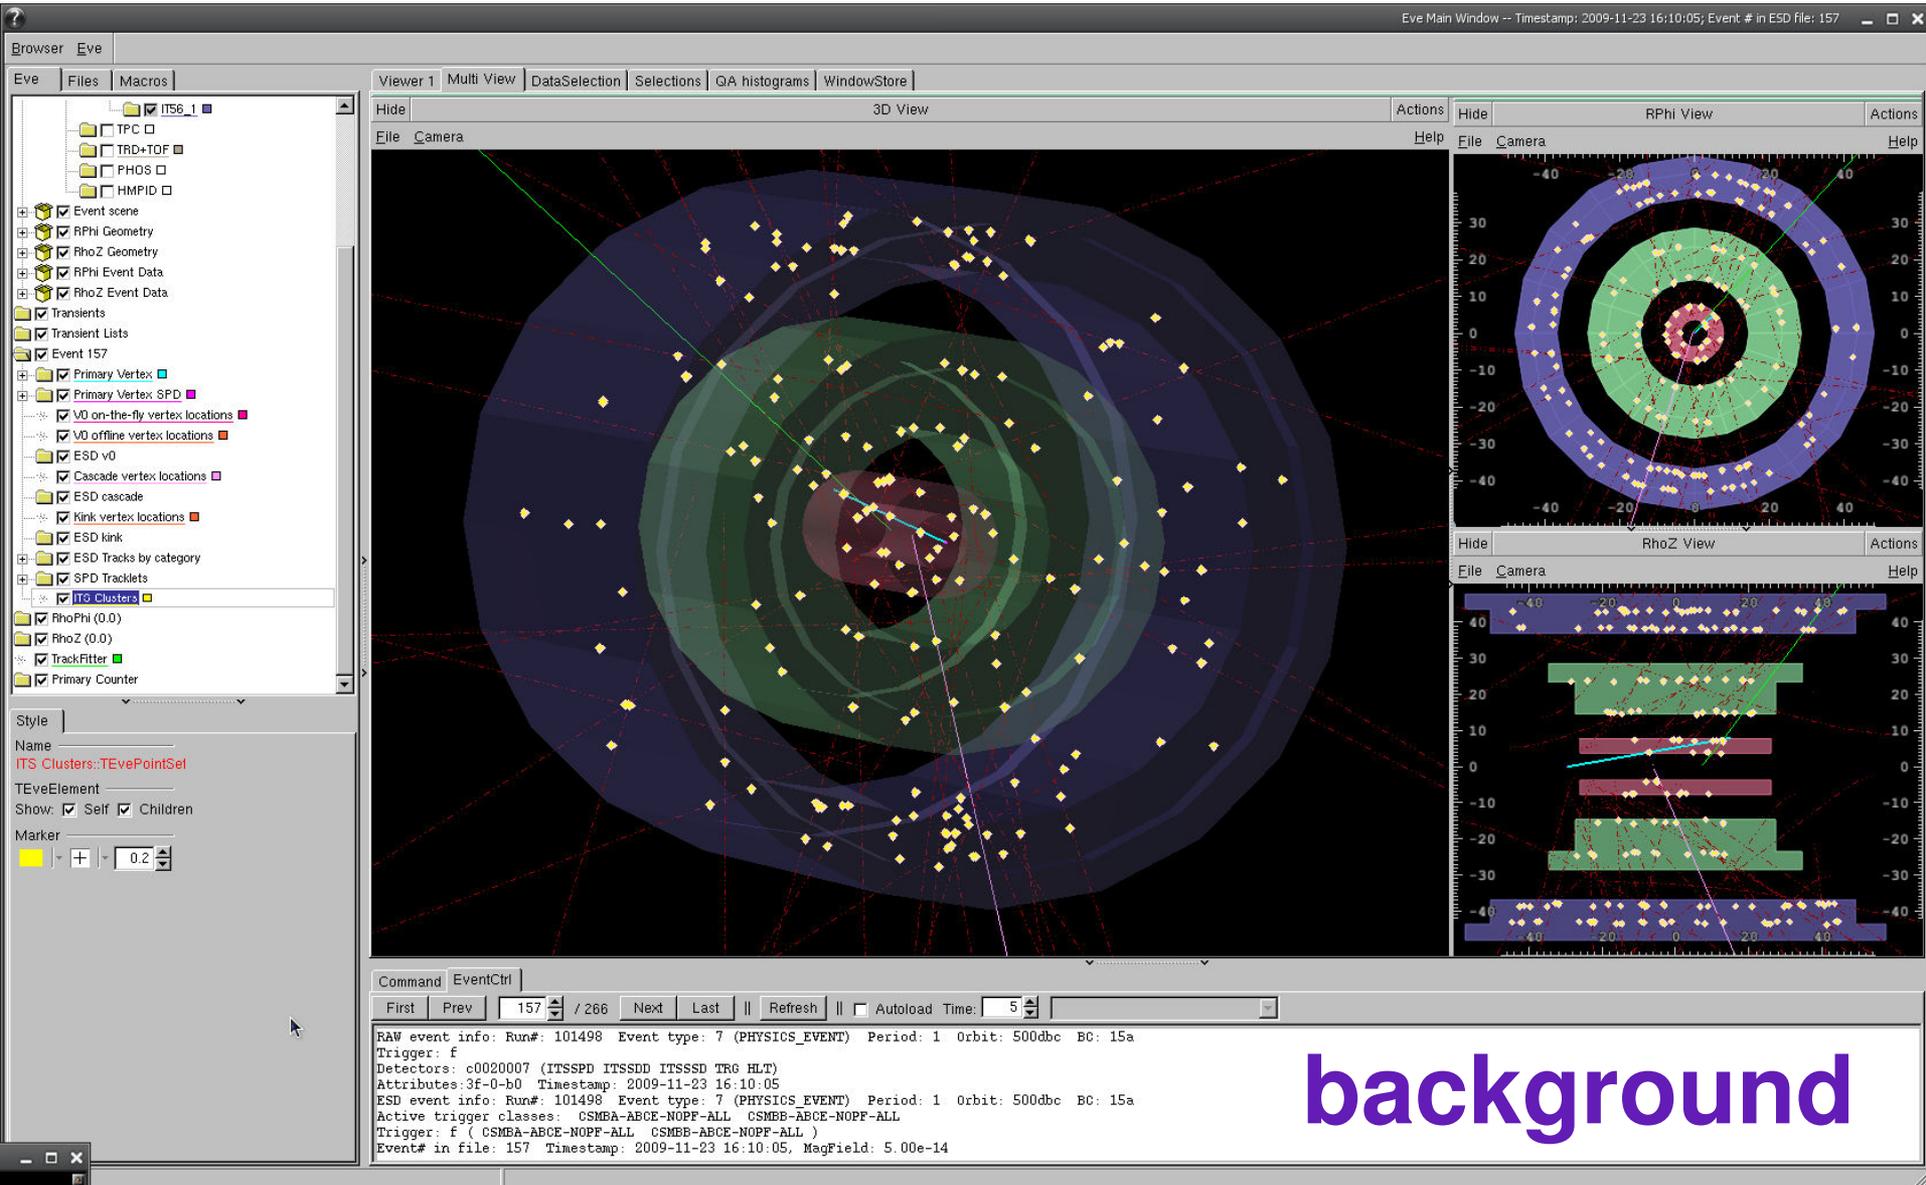

# Analysis experience

Emphasis on tracking and PID, main and secondary vertices reconstruction,

QuickTime™ and a Cinepak decompressor are needed to see this picture.

# Visual inspection and verification

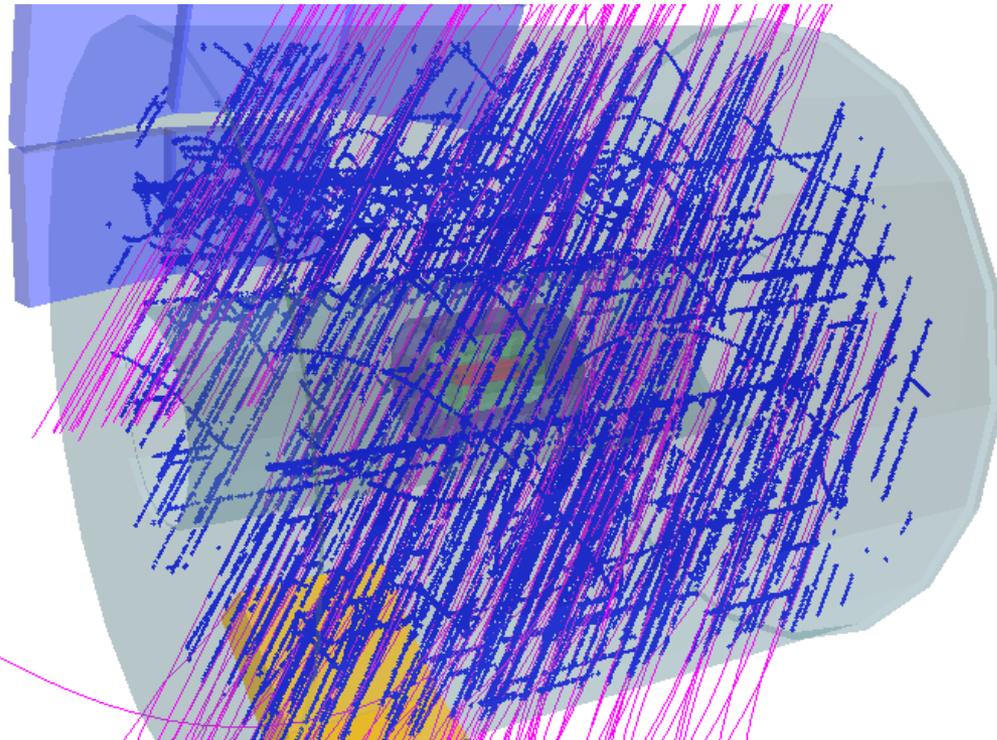

# Visualisation in real life

## ● Visualisation used in real life

- ⇒ First look in ACR; online
- ⇒ Inspect, identify patterns,
- ⇒ Optimise, verify
- ⇒ Suspect events
- ⇒ Interesting events

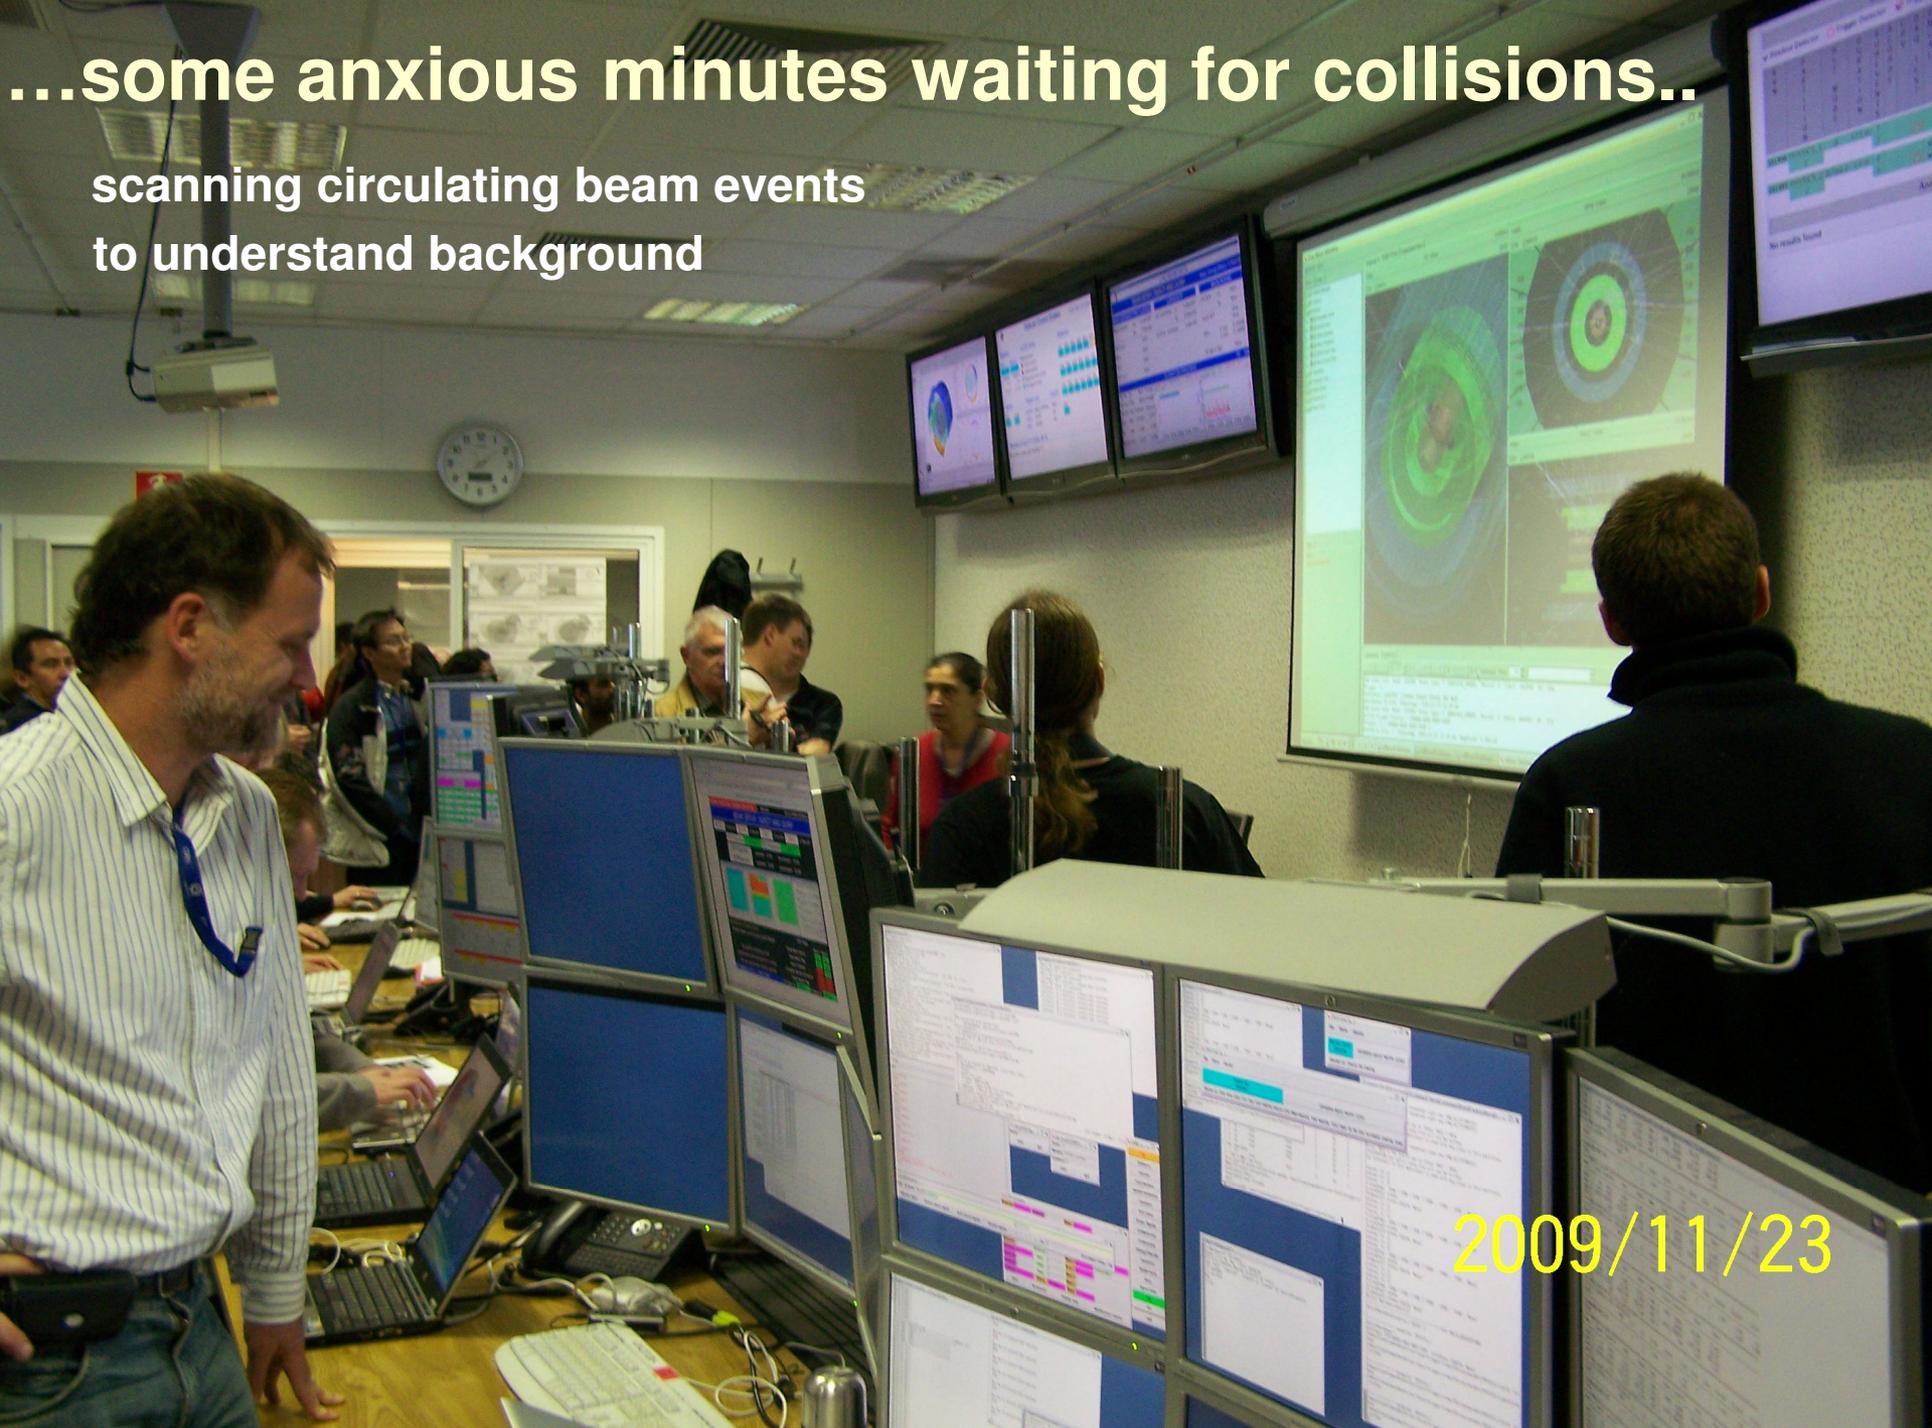

...expect the unexpected...

RUN 109547 chunk 20.10 ev 3723

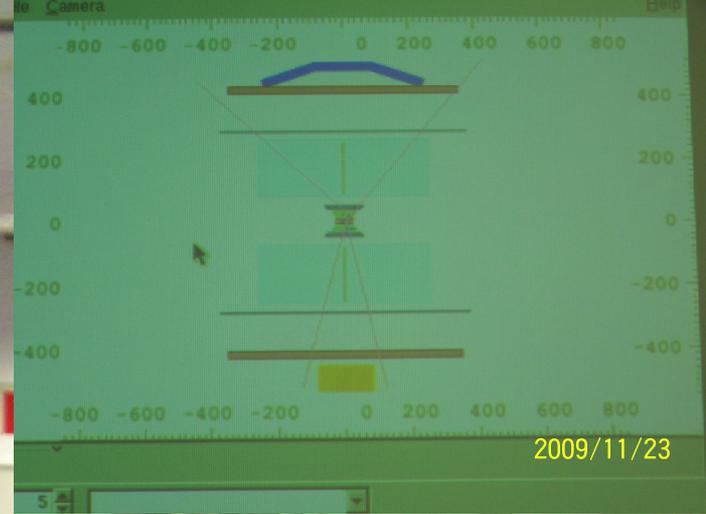

...some anxious minutes waiting for collisions..

scanning circulating beam events  
to understand background

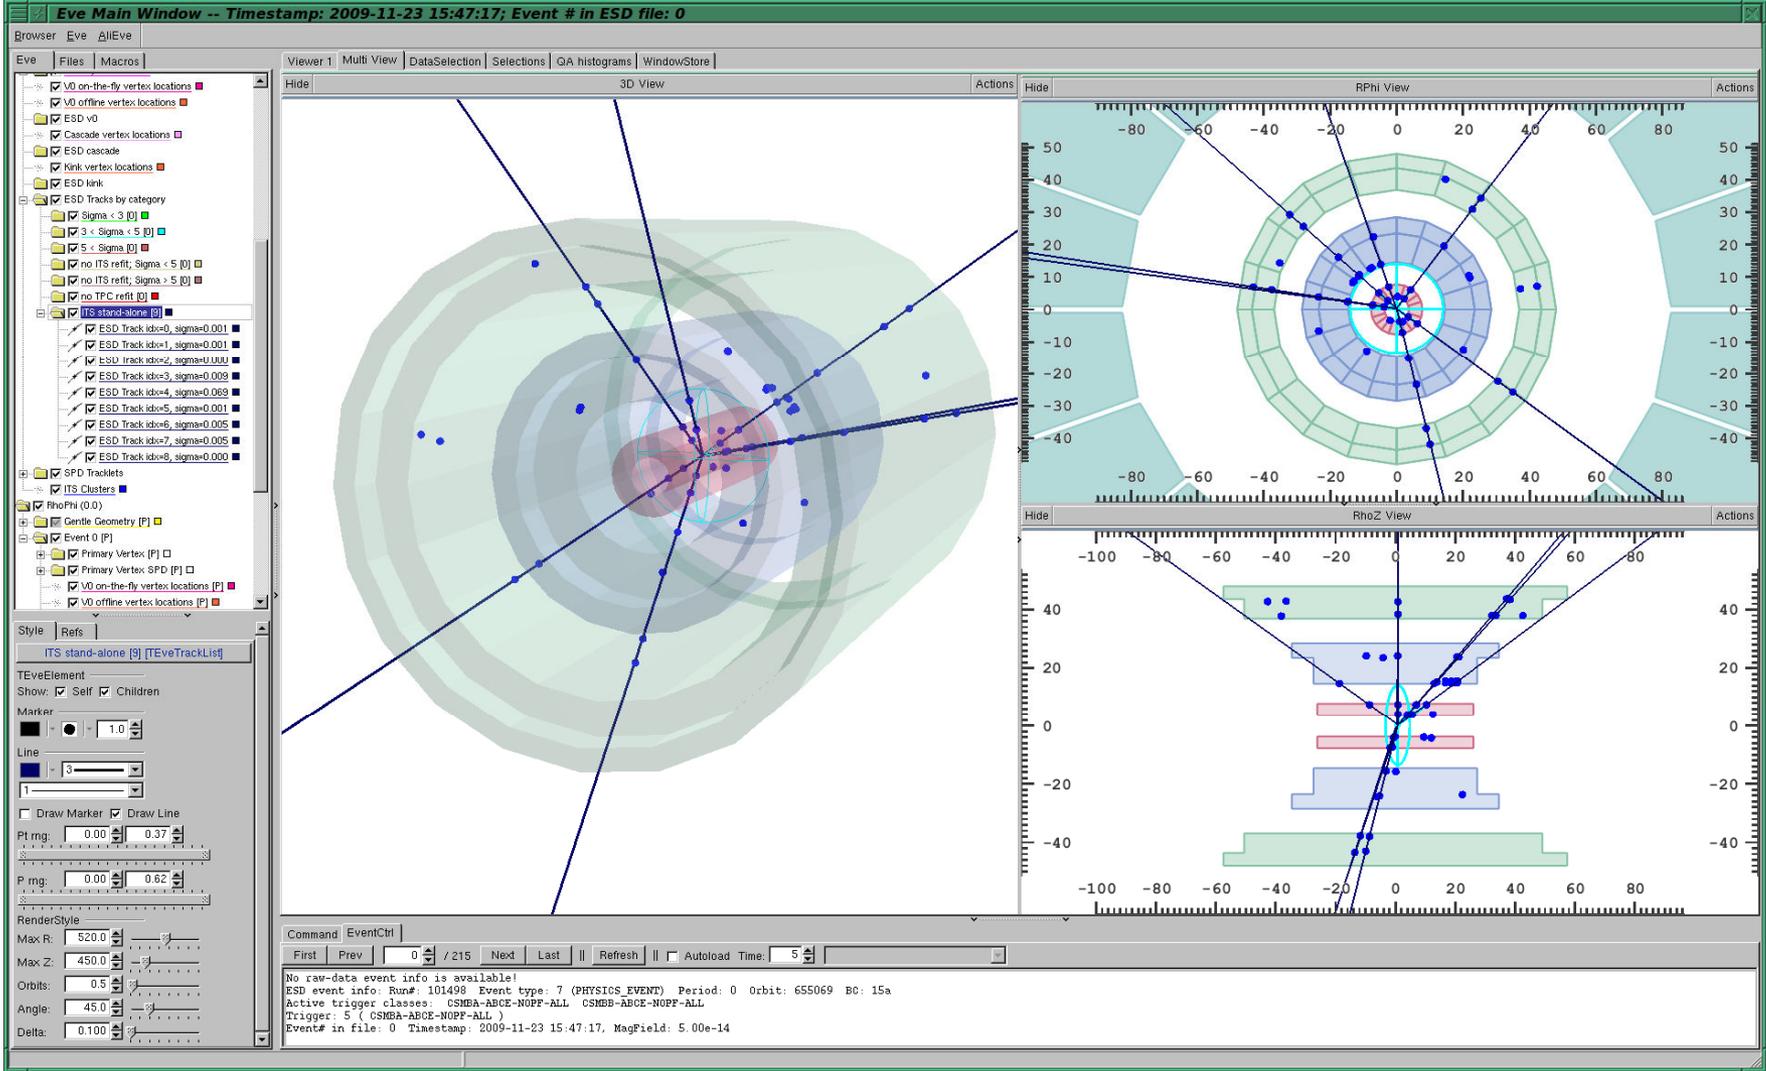

2009/11/23

...some "happy minutes"  
watching collisions...

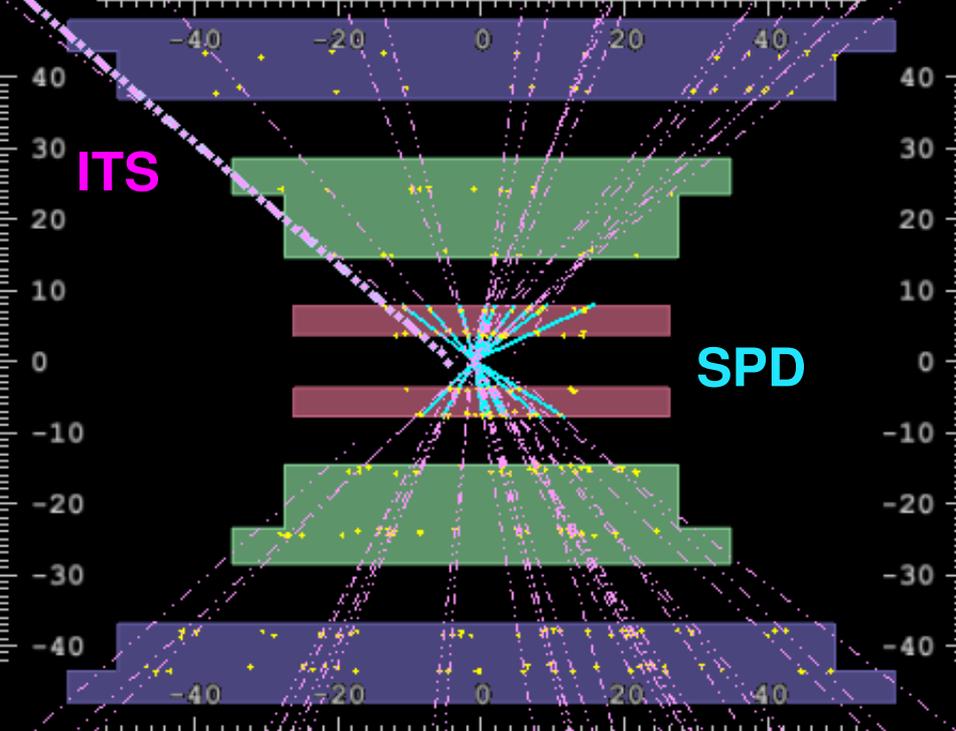

2009/11/23

## Immediate feedback

At 17:21 the beams were dumped and the run closed with 284 events

At 17:28 THE first online reconstructed event

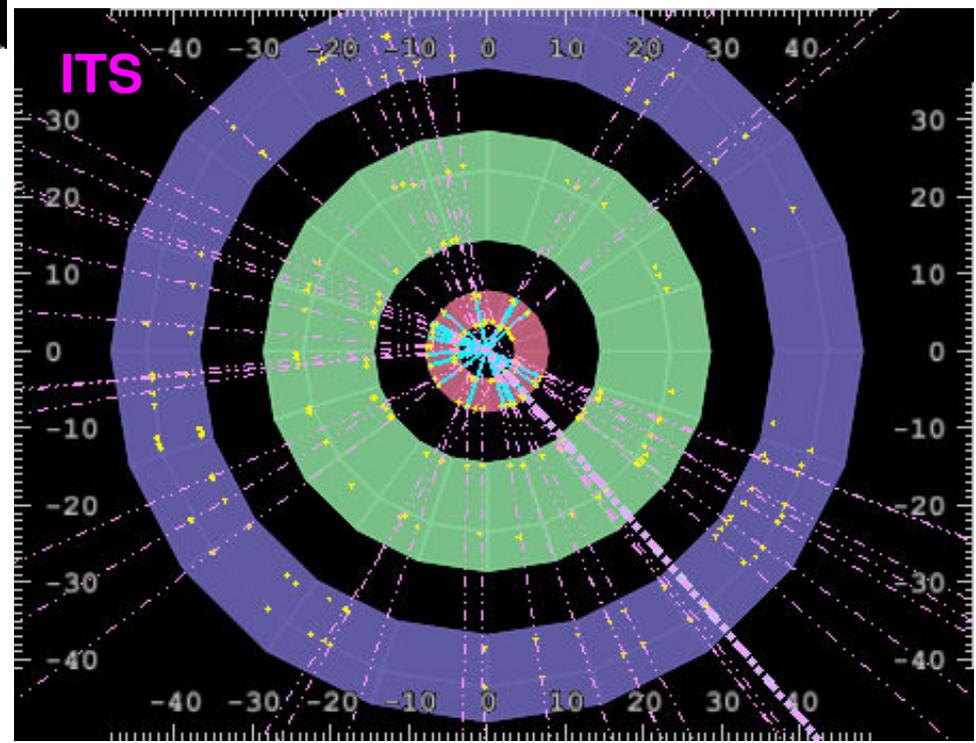

**consistency checks**

**main vertex reconstruction**

**high multiplicity**

1. tracklets reconstructed by SPD
2. global ITS tracks reconstructed by whole ITS !!!

**they match!!**

# Analysis details

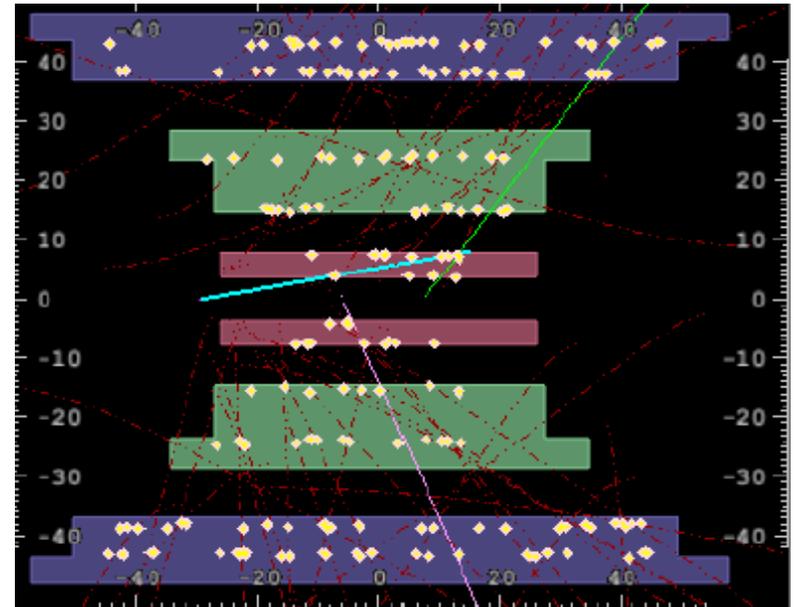

Out of a total of 284 events,  
**227 events**  
were used for the analysis.

Remainder was rejected due to:

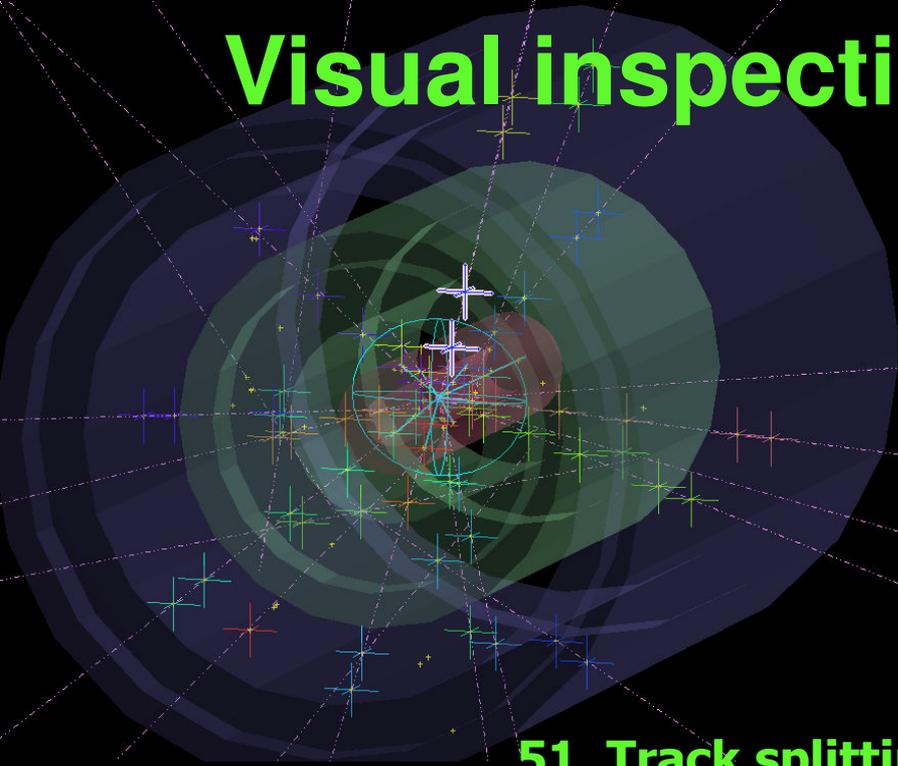

- timing information in V0  
(beam induced background)
- no tracklets found
- no vertex found
- $|z_{\text{vtx}}| > 10$  cm
- clusters vs. tracklets correlation  
in SPD

confirmed by **visual scan**

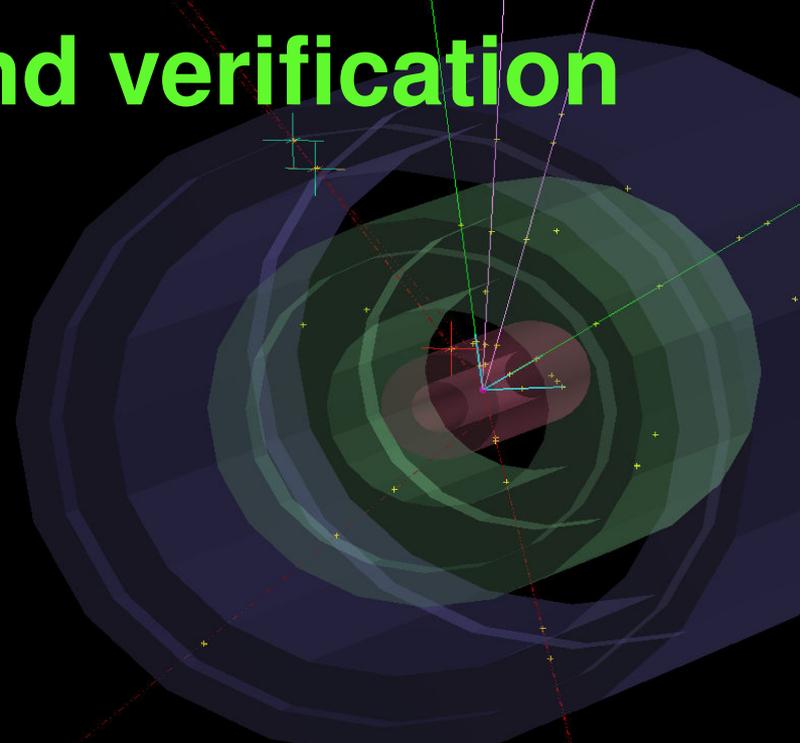

QuickTime™ and a  
Cinepak decompressor  
are needed to see this picture.

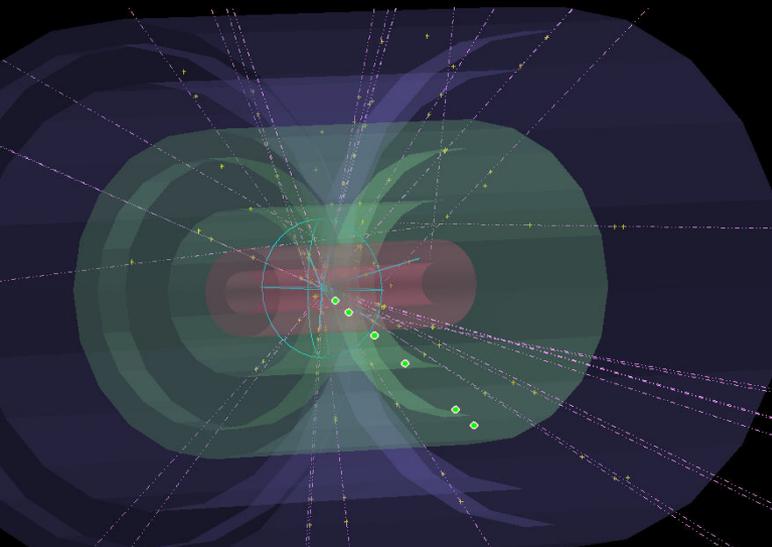

# Visual inspection and verification

**51. Track splitting**

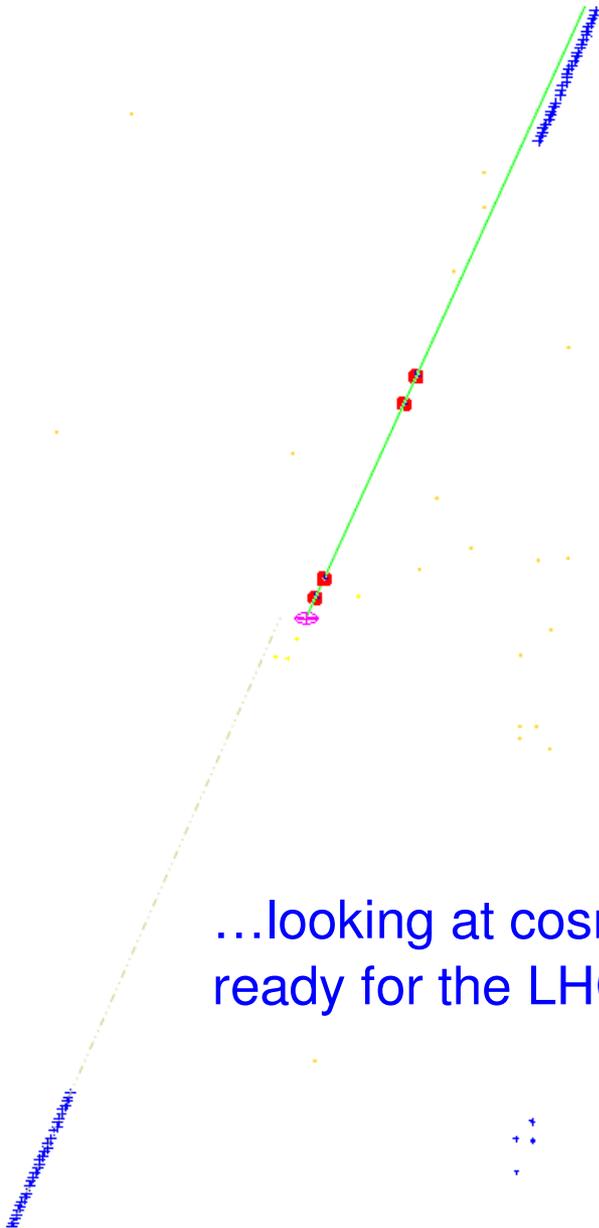

**61. One track split in two**

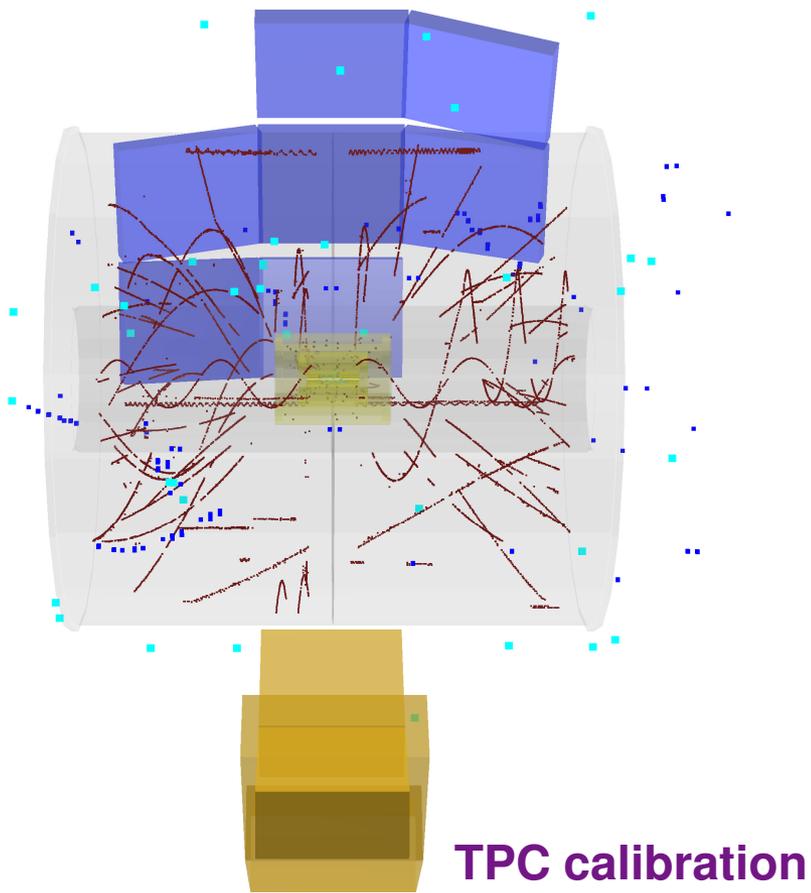

**50. Good tracklet and clusters, no track**

**51. Clusters not associated with track**

...looking at cosmics to get ready for the LHC beams ...

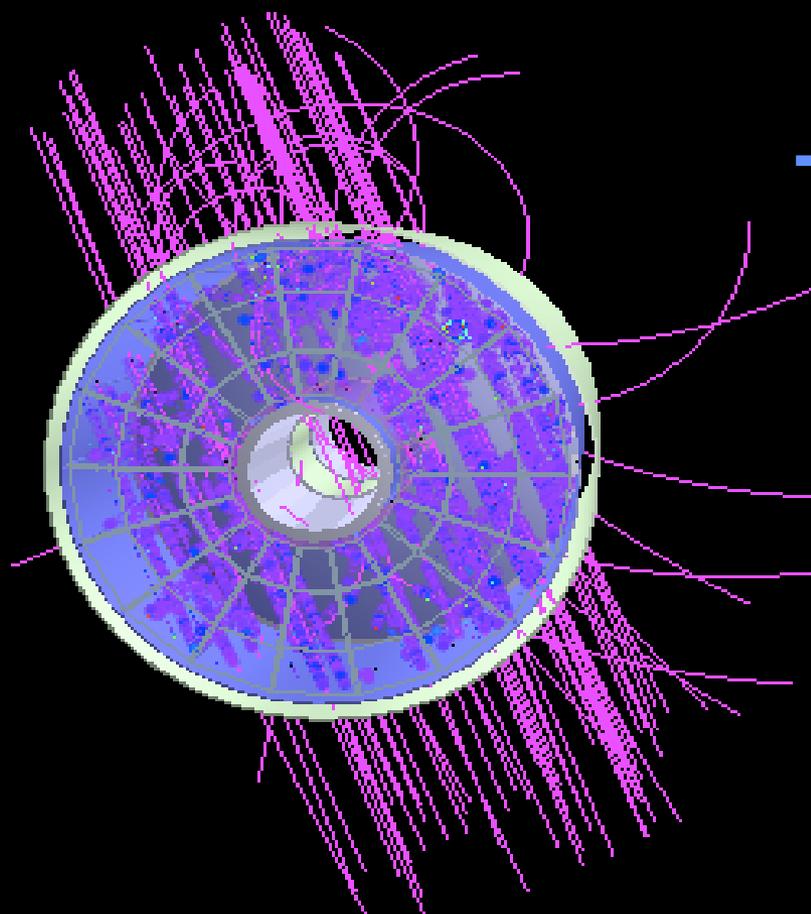

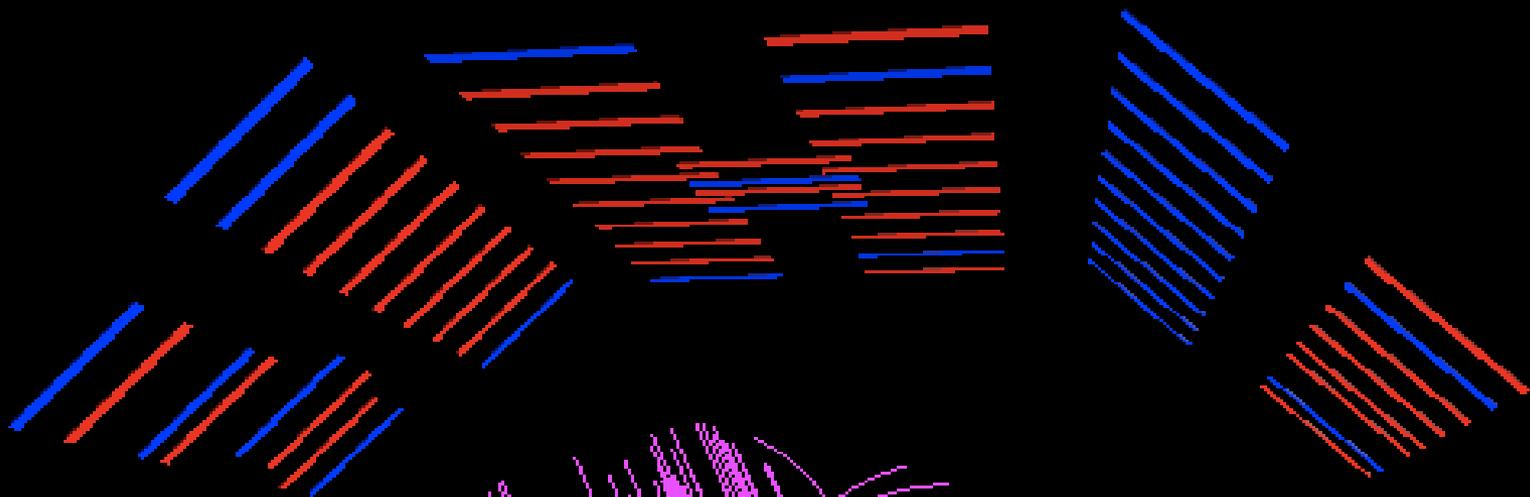

...using cosmics and pp data  
optimize  
detector calibration and  
performance

...and stay open to surprises !!

The image shows a screenshot of a ROOT browser window. On the left side, there is a vertical list of objects, each with a small icon and a name. The names include: its\_hits\_layer\_split, its\_module\_stepper, its\_raw, jetplane, kine\_print, kine\_tracks, mf\_fix, muon\_clusters, muon\_digits, muon\_raw, muon\_trackRefs, phos\_clusters, pmd\_digits, pmd\_hits, pmd\_raw, primary\_vertex, primary\_vertex\_tracks, print\_kine\_from\_label, region\_marker, t0\_digits, t0\_hits, t0\_raw, tof\_clusters, tof\_digits, tof\_digits\_sector, tof\_digits\_strips, tof\_hits, tof\_raw, tpc\_calib\_viewer, tpc\_clusters, tpc\_digits, tpc\_hits, tpc\_hits\_charge\_split, tpc\_hits\_eta\_split, and tpc\_raw. The main area of the window displays a 3D visualization of particle tracks, showing a dense network of blue lines and points within a wireframe structure. The text "recent surprise !!" is overlaid in blue on the top left of this visualization. At the bottom of the window, there is a "Command" field and a "Command (local):" input box.
