## Introduction

## Layout of CLIC at 3 TeV stage

Table: Beam parameters at the entrance of pre-damping ring

Parameters	Value
E [GeV]	2.86
N	$6.6 \times 10^9$
$n_b$	312
$\Delta t_b$ [ns]	1
$\epsilon_{x,y}$ [ $\mu$ m]	7000
$\sigma_z$ [mm]	5.4
$\sigma_E$ [%]	4.5
$f_{\text{rev}}$ [Hz]	50

# Introduction - The positron source sketch

Figure: Schematic layout of the main beam injector complex

## Review 3 TeV - CDR

## Target parameters:

- Primary electron energy: 5 GeV
- Crystal thickness: 1.4 mm ( $0.4\chi_0$ )
- Distance: 2 m
- Amorphous thickness: 10 mm ( $3\chi_0$ )
- **The positron yield after AMD is 8.0**

$$\text{AMD} - B(z) = \frac{B_0}{1 + \mu z}$$

- $B_0 = 6 \text{ T}$ ,  $\mu = 55\text{m}^{-1}$ ,  $L = 20 \text{ cm}$
- **The positron yield after AMD is 2.1**

## Pre-injector

- Accelerating the positrons to 200 MeV
- First decelerating and then accelerating
- Inside the 0.5 Tesla solenoid
- **The positron yield after pre-injector is 0.9**

## Injector Linac

- Accelerating the positron to 2.86 GeV
- A bunch compressor is needed before the injector
- **The positron yield after injector linac is 0.7 (effective: 0.39)**

From CLIC CDR

- All positrons by 99 % are transported.
- All positrons are within 1% acceptance window of the pre-damping ring.

From BPM report by C. Bayar

Positron yield: 0.97

- 1 Introduction & Review

  - Target
  - AMD
  - Traveling Wave Structure
  - Injector linac
- 4 Start-to-end Optimization
- 5 Conclusion

# Motivation

## Main Changes:

- The positron yield before the pre-damping ring has been improved from 0.39 to 0.97<sup>1</sup>
- The first energy stage of CLIC is 380 GeV

## Rationale: improving performance & saving cost

- Reduce the current of the primary electron bunch
- Reduce the energy of the primary electrons bunch
  - 3 GeV is considered.

How? - First, we need to improve the final positron yield as high as possible.

- Start-to-end optimization
  - 5 GeV
  - 3 GeV

# Positron Generation Simulation - Channeling Process

There are two program to simulate the crystal channeling process

- VMS by V. M. Strakhovenko (Budker-INP, Russia)
  - Used for simulation in CLIC CDR
  - Photon distributions with only 4 different electron energies are provided
- FOT by X. Artru <sup>2</sup> (French National Centre for Scientific Research)
  - The primary electron energy and crystal thickness can be scanned

Energy distribution for photons

Px distributions for photons

Discrepancy between two codes: 10% - 20%<sup>3</sup>

Comments from X. Artru:

- The two codes are implemented rather different.
- It is not simple to guess which is better.

<sup>2</sup>X. Artru, NIMB48 (1990) 278-282

# Positron Generation Simulation

## Procedure

Positron yield for CDR case: 7.2

- 1 FOT is used to generate photons in crystal tungsten (coherent & incoherent bremsstrahlung, channeling)
- 2 These photons are set as primary particles in Geant4.
- 3 Standard EM process in Geant4 is simulated in crystal & amorphous tungsten target.

- 1 Introduction & Review
- 2 Motivation
- 3 Subsystems
  - Target
  - **AMD**
  - Traveling Wave Structure
  - Injector linac
- 4 Start-to-end Optimization
- 5 Conclusion

# AMD simulation

Ideal magnetic field on axis:  $B_z(z, 0) = \frac{B_0}{1+\mu z}^4$

- $B_0 = 6 \text{ T}$ ,  $\mu = 55 \text{ m}^{-1}$ , Length = 20 cm

The simulation is done by RF-Track<sup>5</sup> (very fast)

Positron yield after AMD is 2.8

- The parameters can be changed easily.
- It is much easier to do the start-to-end optimization

<sup>4</sup>Off-axis magnetic field is got from CLIC-NOTE-465 by T. Kamitani & L. Rinolfi

<sup>5</sup>A. Latina, MOPRC016, Proceedings of LINAC2016

- 1 Introduction & Review
- 2 Motivation
- 3 Subsystems
  - Target
  - AMD
  - **Traveling Wave Structure**
  - Injector linac
- 4 Start-to-end Optimization
- 5 Conclusion

# Field Map - Need by RF-Track for tracking simulation

The field map for the  $\frac{2\pi}{3}$  traveling wave structure is calculated with CST 2017.

- Wave length  $\lambda = 0.15$  m
- Traveling wave structure length: 1.5 m

$E_z$  On axis

$E_z$  off-axis  $R = 1.5$  cm

$E_r$  at  $Z = 0$

The standing wave solution from SUPERFISH is also used to construct the traveling wave solution. **These two methods are consistent with each other.**

# Decelerating Parts

Positron yield is 1.03

## Accelerating Parts - The following 10 TWs

Positron yield is 0.92

The previous simulation with PARMELA <sup>6</sup> gives positron yield 0.97.

- The new result 0.92 are not different a lot from the previous one
- We can begin the start-to-end simulation

- 5 Conclusion

# Injector Linac

We assume the transmission efficiency in the injector linac is 100%.

$E_f = E_i + \Delta E \cos(2\pi\omega t)$ , here  $t$  is the arrive time at the end of pre-injector

- 1 Introduction & Review
- 2 Motivation
- 3 Subsystems
  - Target
  - AMD
  - Traveling Wave Structure
  - Injector linac
- 4 Start-to-end Optimization**
- 5 Conclusion

# Start-To-End optimization

Primary Electron Bun:

- $E = 5 \text{ GeV} \ \& \ 3 \text{ GeV}, \ \Delta E/E = 10^{-3}$
- $\Delta P_x/P = 10^{-5}$
- $\sigma_{x,y} = 2.5 \text{ mm}, \ \sigma_z = 1 \text{ mm}$

Target:

- Crystal tungsten thickness:  $0.5 \rightarrow 3.0 \text{ mm}$
- Amorphous tungsten thickness:  $6 \rightarrow 20 \text{ mm}$
- Distance between two tungstens:  $0.5 \rightarrow 3 \text{ m}$

The AMD parameters is not optimised for now.

Traveling wave structure - Optimize for each target configuration.

- Phases for the decelerating and accelerating structure
- Gradients for the decelerating and accelerating structure

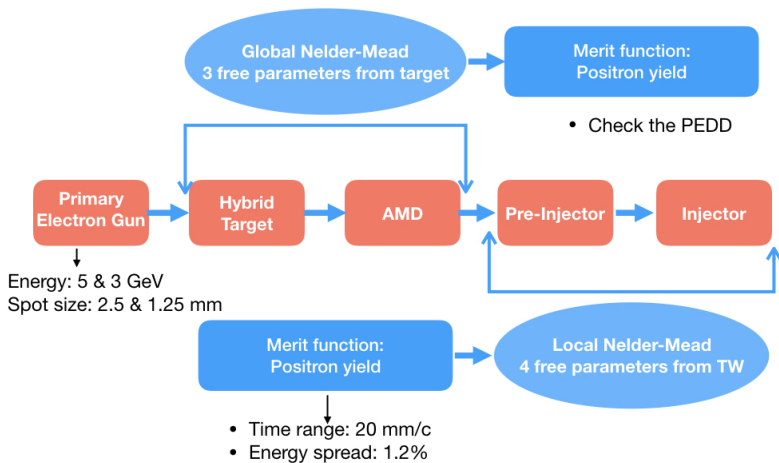

Injector Linacs:

$E_f = E_i + \Delta E \cos(2\pi\omega t)$ , here  $t$  is the arrive time at the end of pre-injector

# Start-to-end optimization - Software version

- FOT - The random generators are changed to the C++ standard library version
- Geant4 - 4.10.04.b01
- GCC - 7.2.1 (or 6.2.0)
- octave - 4.2.1
- RF-Track (updated to 2018-Jan-15th)
- ROOT - 6.12.04
- (placet)

## Start-to-end optimization - Nested Optimization

# Start-to-end optimization - Results - 2.5 mm spot size

## 5 GeV primary electron bunch

- Crystal target thickness: 2.17 mm
- Amorphous target thickness: 16.6 mm
- Distance: 0.67 m
- Phase: -33 & 85 degree
- Gradient: 13.1 & 18.2 MV/m
- Positron yield: 1.30
- PEDD: 17.7 J/g

## 3 GeV primary electron bunch

- Crystal target thickness: 2.20 mm
- Amorphous target thickness: 12.3 mm
- Distance: 0.65 m
- Phase: -43 & 78 degree
- Gradient: 13.7 & 18.0 MV/m
- Positron yield: 0.76
- PEDD: 17.1 J/g

# Start-to-end optimization - Results - 1.25 mm spot size

## 5 GeV primary electron bunch

- Crystal target thickness: 1.68 mm
- Amorphous target thickness: 14.9 mm
- Distance: 0.66 m
- Phase: -30 & 90 degree
- Gradient: 17.2 & 17.5 MV/m
- Positron yield: 1.94
- PEDD: 29.3 J/g

## 3 GeV primary electron bunch

- Crystal target thickness: 1.54 mm
- Amorphous target thickness: 11.5 mm
- Distance: 0.62 m
- Phase: -34 & 88 degree
- Gradient: 15.9 & 17.2 MV/m
- Positron yield: 1.03
- PEDD: 26.7 J/g

# Longitudinal phase space - 5 GeV, 2.5 mm spot size

Target

AMD

TW11

# Longitudinal phase space - 5 GeV, 2.5 mm spot size

Target

AMD

TW11

  - Target
  - AMD
  - Traveling Wave Structure
  - Injector linac
- 4 Start-to-end Optimization
- 5 Conclusion

# Conclusion

- The positron source start-to-end optimization environment is setup successfully
  - The program FOT is used to simulate the channeling process in crystal tungsten.
  - Geant4 is used to simulation the electromagnetic process in crystal & amorphous tungsten target.
  - AMD & traveling wave structure are simulation by RF-Track with proper field-map.
  - The injector linac is considered by simple calculation.
- The positron yield is determined as (within the PEDD limit):

Table: Positron yield

Positron yield	5 GeV	3 GeV
• 2.5 mm spot size	1.30	0.76
1.25 mm spot size	1.94	1.03

Thank you!

# Backup

# Difference between FOT & VMS

- coherent bremsstrahlung & channeling
  - FOT: Baier-Katkov formula - include non-uniformity field
  - VMS: uniform field approximation.
- incoherent bremsstrahlung
  - FOT: included in Baier-Katkov formula
  - VMS: calculated separately
- $e^+e^-$  pair production
  - FOT: Not included, should be simulated in Geant4
  - VMS: Coherent effects is considered when pair is produced in VMS
