Extensive & Intensive Integration of Collaborative Editing in Sync&Share Platforms

Monday 28 January 2019 16:20 (20 minutes)

ONLYOFFICE by Ascensio System SIA is an HTML5-based online suite for collaborating on text documents, spreadsheets and presentations online. Here, maximizing format compatibility, establishing browser-agnostic content display and optimizing real-time data transfer in co-authoring are the important core principles in building applicable editing software.

But once the solution is tailored to the industry standards internally, deeper integration in popular Sync&Share solutions becomes a reasoned next stage. That strategy is defined by both end user-side demand and the results the 'division of labor' practice has delivered in cloud software development so far.

However, the design lays not only in own on-demand development of the integration apps, but also in closer strategic collaboration between the vendors themselves, creation of the accessible documentation and joint support, and encouraging the developer community to take part in the efforts.

This year's presentation will cover:

- Review of the technical basis of ONLYOFFICE solutions;
- Providing open API to allow creating third-party connectors;
- Recent achievements in integrating the suite with Sync&Share platforms (e.g. Nextcloud and own-Cloud);
- Connecting desktop environments to cloud sharing platforms;
- Security technologies in collaborative editing;
- ONLYOFFICE integration roadmap.
