

QCD uncertainties in forward-backward asymmetries of b-quarks in e^+e^- at the Z pole

FCC week 2019

Brussels, 27th June 2019

David d'Enterria (CERN)

Cynthia Yan (HMC, Clareton)

Couplings of the Z boson to fermions

- SM **electroweak interaction** Lagrangian in terms of weak & e.m. currents:

$$\mathcal{L} = g\vec{J}\cdot\vec{W} + g'J^Y B = \frac{g}{\sqrt{2}}(J^-W^+ + J^+W^-) + \frac{g}{\cos\theta_W}(J^3 - \sin^2\theta_W J^{EM})Z^0 + eJ^{EM}A^0$$

W^\pm couplings of strength g to weak-isospin J^\pm

Z neutral couplings: mixed weak-isospin J^3 + e.m.

γ couplings of strength e

Weak-isospin (I_3), hypercharge (Y) & e.m. (Q) couplings & charges:

$$g \sin\theta_W = g' \cos\theta_W = e, \quad \sin^2\theta_W = 0.22$$

$$Q = I_3 + \frac{Y}{2} \quad J^{EM} = J^0 + \frac{1}{2}J^Y$$

- Electron-positron annihilation into fermions: $e^+e^- \rightarrow Z \rightarrow f\bar{f}$

Z boson has left-handed (from J^3, J^{em}) & right-handed (from J^{em}) couplings to fermions:

$$g_L = I_3 - Q \sin^2\theta_W \quad g_R = -Q \sin^2\theta_W$$

These are usually expressed as vector and axial-vector couplings c_V and c_A :

$$c_V = g_L + g_R = I_3 - 2Q \sin^2\theta_W$$

$$c_A = g_L - g_R = I_3$$

and the vertex coupling for a neutral current interaction is written:

$$i \frac{g}{\cos\theta_W} \gamma^\mu \frac{1}{2} (c_V - c_A \gamma^5)$$

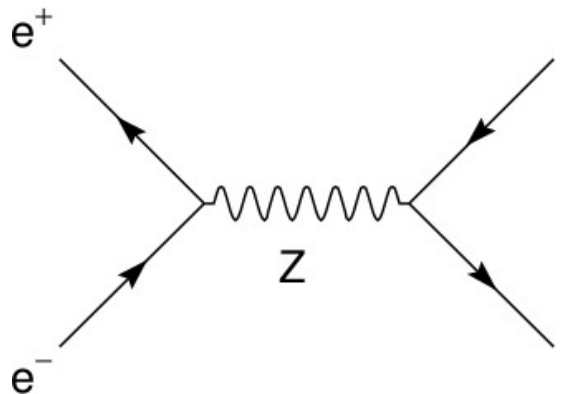

Note that c_V and c_A have different values for different types of fermion.

Lepton	$2c_V$	$2c_A$	Quark	$2c_V$	$2c_A$
ν_e, ν_μ, ν_τ	1	1	u, c, t	$1 - \frac{8}{3} \sin^2\theta_W$	1
e, μ, τ	$-1 + 4 \sin^2\theta_W$	-1	d, s, b	$-1 + \frac{4}{3} \sin^2\theta_W$	-1

Z couplings depend on the fermion Q, I_3 (i.e. diff. for diff. lepton/quark type)

Forward-backward $e^+e^- \rightarrow f\bar{f}$ asymmetries

- Mixed Z vector & axial-vector couplings induce asymmetries in angular distributions of the final-state fermions (a part from e^\pm helicity, and polarization of the produced particles) fully determined by weak mixing angle:

$$\frac{d\sigma_{f\bar{f}}}{d\cos\theta} = \frac{3}{8}\sigma_{f\bar{f}}^{\text{tot}} \left[(1 - \mathcal{P}_e \mathcal{A}_e)(1 + \cos^2\theta) + 2(\mathcal{A}_e - \mathcal{P}_e)\mathcal{A}_f \cos\theta \right]$$

$$\mathcal{A}_f = \frac{g_{L_f}^2 - g_{R_f}^2}{g_{L_f}^2 + g_{R_f}^2} = \frac{2g_{V_f}g_{A_f}}{g_{V_f}^2 + g_{A_f}^2} = 2 \frac{g_{V_f}/g_{A_f}}{1 + (g_{V_f}/g_{A_f})^2}$$

$$\frac{g_{V_f}}{g_{A_f}} = 1 - \frac{2Q_f}{T_3^f} \sin^2\theta_{\text{eff}}^f = 1 - 4|Q_f| \sin^2\theta_{\text{eff}}^f$$

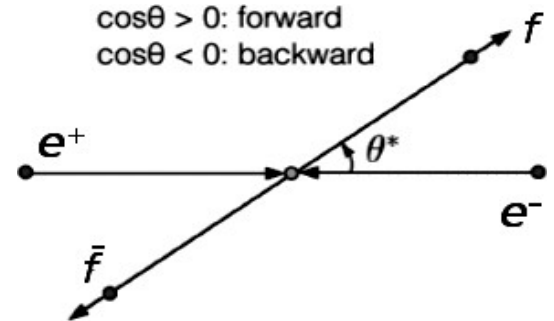

- Experimentally: Take ratio of number of forward (backward) (anti)fermions in hemisphere defined by the direction of the e^- (e^+) beam: $\theta < (>) \pi/2$.

The $\cos\theta$ term gives a forward-backward asymmetry

$$A_{FB}^b = \frac{N_F - N_B}{N_F + N_B}$$

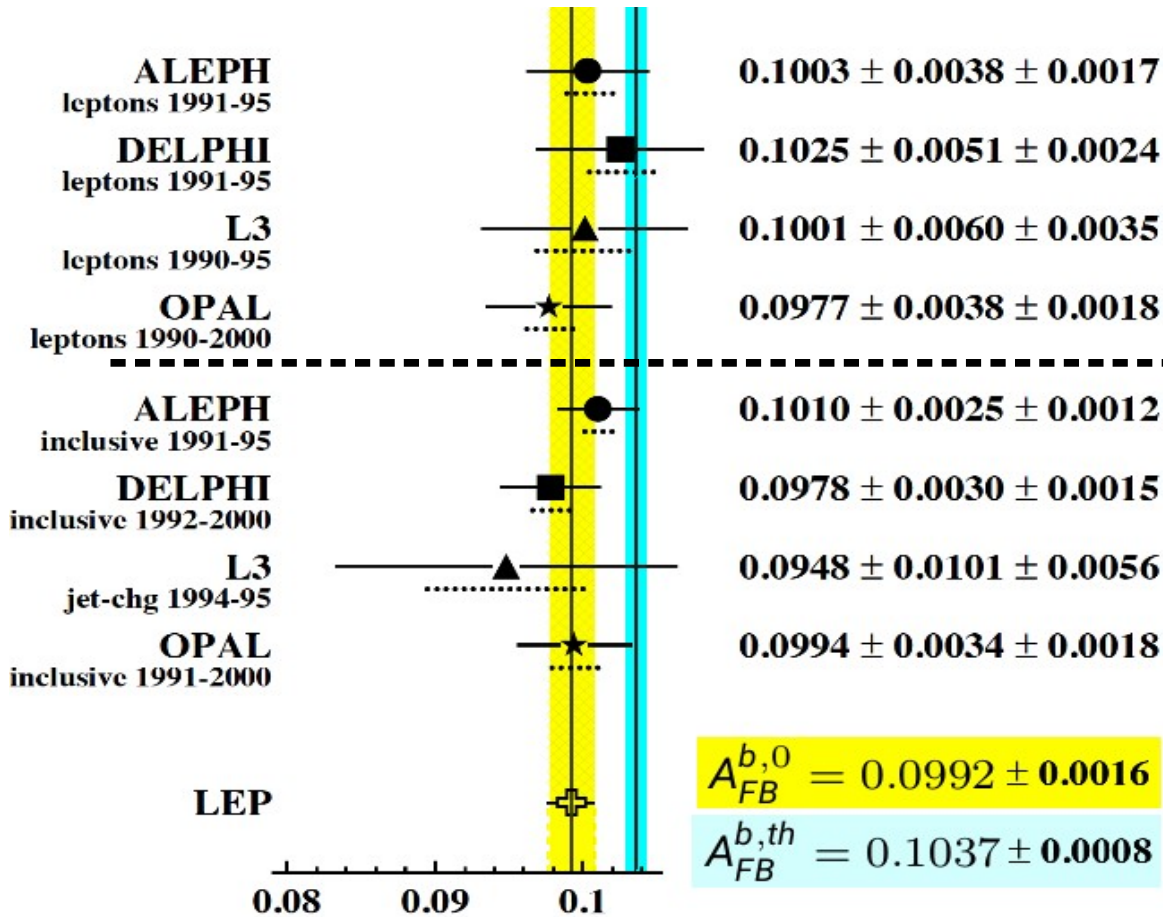

$$F = \int_0^1 \frac{d\sigma}{d\Omega} d\Omega$$

$$B = \int_{-1}^0 \frac{d\sigma}{d\Omega} d\Omega$$

Forward-backward $b\bar{b}$ asymmetry around Z pole

- LEP expts. carried out **8 measurements** (lepton- or jet-charge based) of A_{FB}^b (largest & most accurately measured one of all fermions):

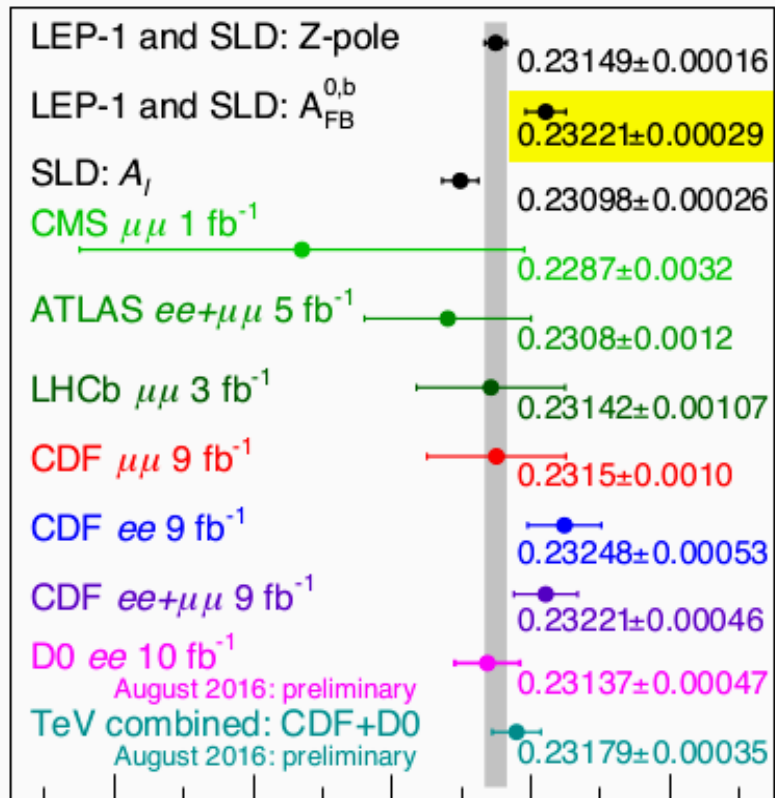

- Experimental b-quark asymmetry has a **~ 2.8 pull w.r.t. theoretical prediction** including QED/EWK, NNLO QCD, b-quark mass, jet/thrust axis corrections

$\sin^2\theta_{\text{eff}}$ from $b\bar{b}$ fwd-bckwd asymmetry in e^+e^-

- Effective **weak angle** from b-quark asymmetry at Z pole is 2.6σ away from world-average. **Largest TH-EXP discrepancy among EWPOs:**

$$\sin^2\theta_{\text{eff}}^{\text{lept}} \Big|_{\text{TeV+LHC}} = 0.23166 \pm 0.00032$$

b-quark asymmetry uncertainties at the Z pole

■ Experimental uncertainties on $A_{\text{FB}}^{0,b}$ extraction:

– **Statistical: $\pm 1.5\%$**

At planned FCC-ee,
with $\times 10^5$ more $e^+e^- \rightarrow Z$'s
than LEP, stat. uncert.
will be negligible: **$\sim 0.05\%$**

– **Systematics: $\pm 0.6\%$**

QCD-related: $\pm 0.5\%$

Table 1: LEP measurements of $A_{\text{FB}}^{0,b}$ and associated statistical, total systematic, and QCD-systematic uncertainties (with the newly-computed QCD systematics quoted in parentheses).

Measurement	$A_{\text{FB}}^{0,b}$	uncertainties			
		stat.	total syst.	QCD syst.	(new)
ALEPH lepton (2002) ⁴	$0.1003 \pm 0.0038 \pm 0.0017$	4.1%	1.7%	0.6%	(0.8%)
DELPHI lepton (2004-5) ⁵	$0.1025 \pm 0.0051 \pm 0.0024$	6.4%	2.4%	1.5%	(1.3%)
L3 lepton (1999) ⁶	$0.1001 \pm 0.0060 \pm 0.0035$	6.9%	3.4%	1.8%	(0.8%)
OPAL lepton (2003) ⁷	$0.0977 \pm 0.0038 \pm 0.0018$	4.3%	1.5%	1.1%	(1.4%)
ALEPH jet-charge (2001) ⁸	$0.1010 \pm 0.0025 \pm 0.0012$	2.7%	1.1%	0.5%	(0.5%)
DELPHI jet-charge (2005) ⁹	$0.0978 \pm 0.0030 \pm 0.0015$	3.3%	1.5%	0.5%	(0.4%)
L3 jet-charge (1998) ¹⁰	$0.0948 \pm 0.0101 \pm 0.0056$	10.8%	5.9%	4.1%	(0.4%)
OPAL jet-charge (2002) ¹¹	$0.0994 \pm 0.0034 \pm 0.0018$	3.7%	1.8%	1.5%	(0.3%)

■ QCD biases on $A_{\text{FB}}^{0,b}$ (depending strongly on exp. selection procedure):

– **Hard gluon radiation** (controlled theoretically via α_s^2 NNLO corrections)

– Smearing of **b-jet (thrust) axis** due to:

- (1) **b and (b \rightarrow) c soft radiation & hadronization.**
- (2) **B and D hadron decay models.**

[Estimated via parton-shower simulations by
Abbate et al.,
EPJC 4 (1998)]

QCD Monte Carlo setup (I)

- LEP QCD uncertainties based on JETSET (1998). Lots of progress in parton-shower & hadronization in the last 20 years. Impact on A_{FB} ?
- We run $10^7 e^+e^- \rightarrow Z \rightarrow bb$ events in 8(x8) MC setups mimicking the 8 (4 lepton-based, 4 jet-charge-based) LEP measurements.
- PYTHIA 8.226 with 7 different parton-shower & hadronization tunes:

tune 1	the original PYTHIA8 parameter set, based on some very old flavor studies (with JETSET around 1990) and a simple tune of α_s to three-jet shapes to the new pT-ordered shower.
tune 2	a tune by Marc Montull to the LEP 1 particle composition, as published in the RPP (August 2007).
tune 3	a tune to a wide selection of LEP1 data by Hendrik Hoeth within the Rivet + Professor framework, both to hadronization and timelike-shower parameters (June 2009).
tune 4	a tune to LEP data by Peter Skands, by hand, both to hadronization and timelike-shower parameters (September 2013). use CMW convention for the shower α_s scale.
tune 5	first tune to LEP data by Nadine Fischer (September 2013), based on the default flavor-composition parameters. Input is event shapes (ALEPH and DELPHI), identified particle spectra (ALEPH), multiplicities (PDG), and B hadron fragmentation functions (ALEPH).
tune 6	second tune to LEP data by Nadine Fischer (September 2013).
tune 7	the Monash 2013 tune by Peter Skands at al. to both $e^+ + e^-$ and $pp/p\bar{p}$ data.

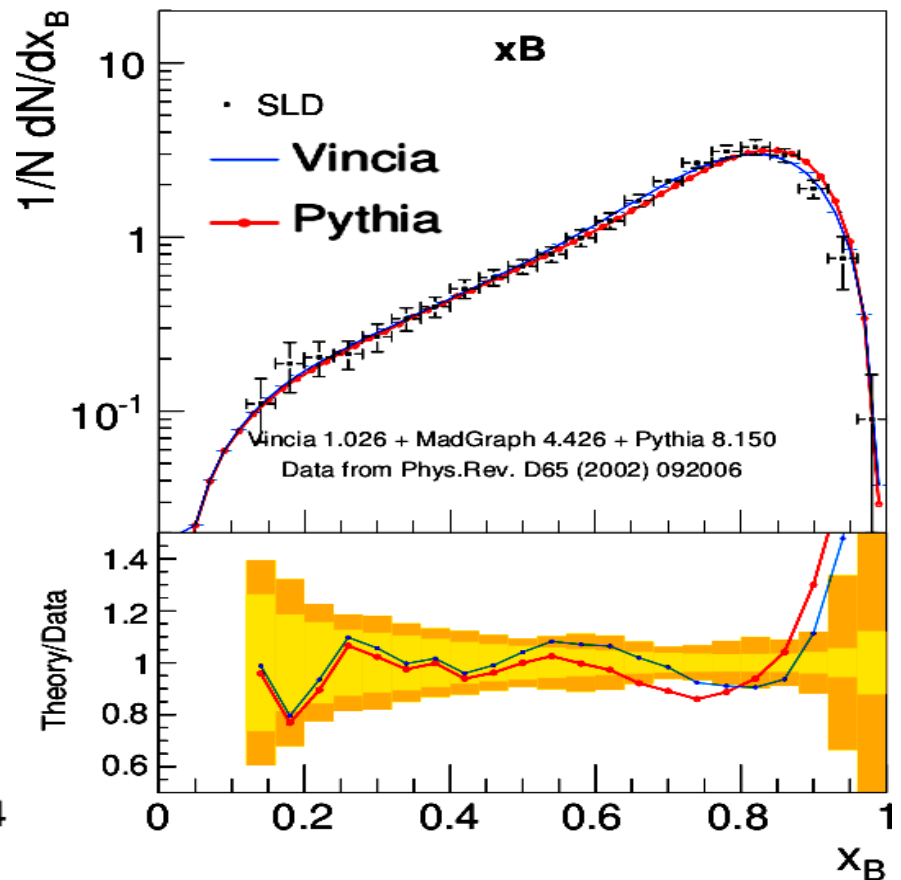

QCD Monte Carlo setup (II)

- We run 10^7 $e^+e^- \rightarrow Z \rightarrow bb$ events in 8(\times 8) MC setups mimicking the 8 (4 lepton-based, 4 jet-charge-based) LEP measurements.
- **PYTHIA 8.226+VINCIA 2.2** (alternative dipole antenna parton shower):
Different PS impacts **b-jet thrust & (refitted) $b \rightarrow B$** fragmentation:
Central VINCIA tune with uncertainty given by **10 parameter variations**:

variation 0	Current (user) settings.
variation 1	Default settings (default antenna functions, default α_s settings).
variation 2	User settings with $\alpha_s(Q/k_\mu^{ub})$, where $Q = k_\mu \mu_R$ is the user scale choice and k_μ^{ub} is an additional scaling factor.
variation 3	User settings with $\alpha_s(k_\mu^{ub} Q)$.
variation 4	MAX antenna set (large finite terms) with user α_s settings.
variation 5	MIN antenna set (large finite terms) with user α_s settings.
variation 6	NLO-Hi : user settings with branching probabilities multiplied by $(1 + \alpha_s(Q))$ to represent unknown (but finite) NLO corrections.
variation 7	NLO-Lo : as above, but with division instead of multiplication.
variation 8	User settings with all color factors for gluon emission =3 .
variation 9	User settings with all color factors for gluon emission =8/3 .
variation 10	User settings with a modified Pimp factor , scales enter with 4th power instead of 2nd power, only if smooth ordering on.

QCD Monte Carlo setup (II)

- We run 10^7 $e^+e^- \rightarrow Z \rightarrow bb$ events in 8(\times 8) MC setups mimicking the 8 (4 lepton-based, 4 jet-charge-based) LEP measurements.
- **PYTHIA 8.226+VINCIA 2.2** (alternative dipole antenna parton shower)
Different PS impacts **b-jet thrust & (refitted) $b \rightarrow B$ fragmentation**:

$e^+e^- \rightarrow b\bar{b}$ at $\sqrt{s} \approx 91.2$ GeV: MC simulation analyses

- Original LEP analyses reimplemented in 8x8 PY8(+VINCIA) simulations:

lepton measurement	lepton cuts applied	jet-based measurement	jet-charge cuts applied
ALEPH-2002	$y_{cut} \geq 0.02$. $M_{jet} \geq 6\text{GeV}/c^2$. For e , $p \geq 2\text{GeV}/c$. For μ , $p \geq 2.5\text{GeV}/c$.	ALEPH-2001	$y_{cut} \geq 0.02$. $M_{jet} \geq 6\text{GeV}/c^2$. $\kappa = 0.5$
DELPHI-2004	$y_{cut} \geq 0.01$. For e , $p \geq 2\text{ GeV}/c$. For μ , $p \geq 2.5\text{ GeV}/c$. For both e and μ , $p_{\perp} \geq 1.6\text{ GeV}/c$.	DELPHI-2005	$y_{cut} \geq 0.01$. $\kappa = 0.6$
L3-1999	$y_{cut} \geq 0.02$. $M_{jet} \geq 6\text{GeV}/c^2$. For e , $p \geq 3\text{ GeV}/c$. For μ , $p \geq 4\text{ GeV}/c$. For both e and μ , $p_{\perp} \geq 1\text{GeV}/c$	L3-1998	$y_{cut} \geq 0.02$. $M_{jet} \geq 6\text{GeV}/c^2$. $\kappa = 0.4$
OPAL-2003	$y_{cut} \geq 0.02$. For both e and μ , $p \geq 2\text{ GeV}/c$.	OPAL-2002	$y_{cut} \geq 0.02$. $\kappa = 0.5$

Lepton-based A_{FB}^b measurements

- Original LEP analyses reimplemented in **8×8 PY8(+VINCIA) simulations**:
 - Reconstruct b-jets with **Jade algorithm**.
 - **Determine the thrust axis** of event (as a proxy of the $b\bar{b}$ direction)
 - Determine b-quark charge from **hardest lepton charge**.
 - **Measure θ** between e^- and thrust axis
 - **Fit** differential cross section and extract A_{FB}^{obs}

$$\frac{d\sigma}{d\cos\theta} = \sigma \frac{3}{8} \left(1 + \cos^2\theta + \frac{8}{3} A_{FB}^{obs} \cos\theta \right)$$

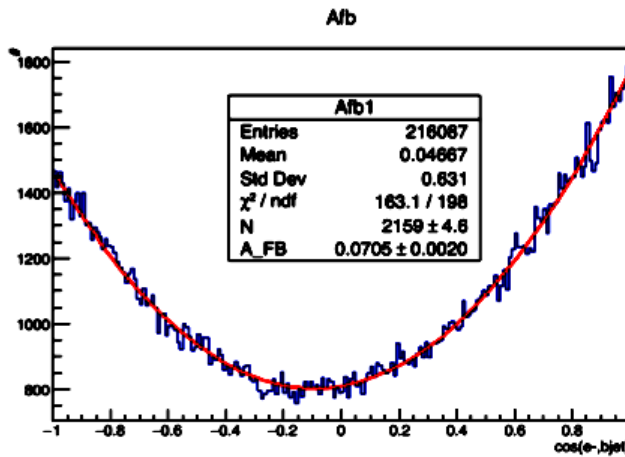

- Correct for $\chi_B \sim 0.12$ to transform A_{FB}^{obs} to A_{FB}^b

$$A_{FB}^{obs} = A_{FB}^b (1 - 2\chi_B)$$

χ_B : the $B^0\bar{B}^0$ effective mixing parameter (the probability that a semileptonically decaying b -quark is reconstructed as a \bar{b} -quark)

Lepton-based A_{FB}^b extraction

Examples of fits of reconstructed polar angle $\frac{d\sigma}{d\cos\theta}$ distributions (tune= 7)

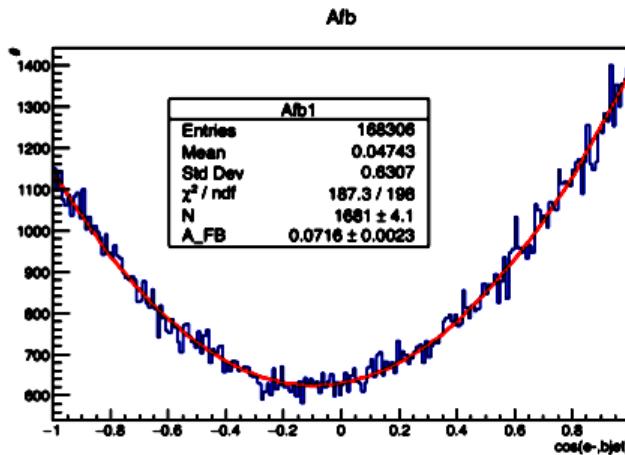

ALEPH-2002

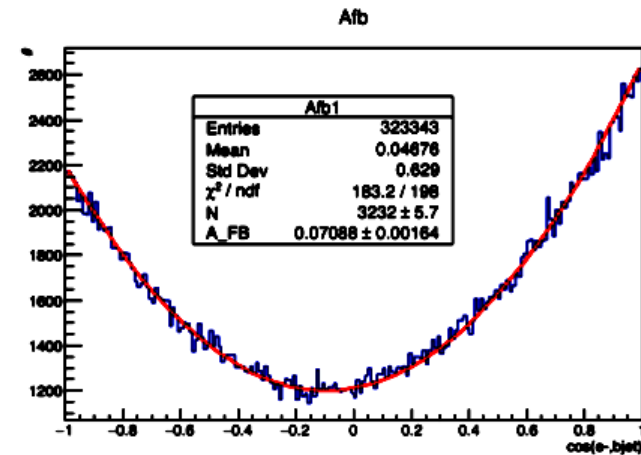

DELPHI-2004

$$\frac{d\sigma}{d\cos\theta} = \sigma \frac{3}{8} \left(1 + \cos^2\theta + \frac{8}{3} A_{FB}^{obs} \cos\theta \right)$$

L3-1999

OPAL-2003

Jet-charge-based A_{FB}^b measurements

- Original LEP analyses reimplemented in **8×8 PY8(+VINCIA) simulations**:

- Reconstruct b-jets with **Jade algorithm**.
- **Determine the thrust axis** of the event (as a proxy of the $b\bar{b}$ direction)
- Identify b -quark and \bar{b} -quark using **jet charge** $Q_J = \frac{\sum p_L^{\kappa} Q}{\sum p_L^{\kappa}}$ where p_L is the longitudinal momentum of the final-state particles with respect to the thrust axis
- Extract A_{FB}^{obs} by **fitting $\cos \theta$ distribution**

$$\frac{\langle Q_F - Q_B \rangle}{\langle Q_b - Q_{\bar{b}} \rangle} = A_{FB}^{obs} \frac{8}{3} \frac{\cos \theta}{1 + \cos^2 \theta}$$

Q_F jet charge in the forward hemisphere

Q_B jet charge in the backward hemisphere

- **Correct for missing higher-order QCD terms** and for difference between **thrust axis and b -direction** $1 + C = 1.00319 \pm 0.00033$

(full QCD correction in an unbiased sample of $b\bar{b}$ events: C value is slightly different for parton- and hadron-level corrections, and is experiment-dependent)

Jet-charge-based A_{FB}^b extraction

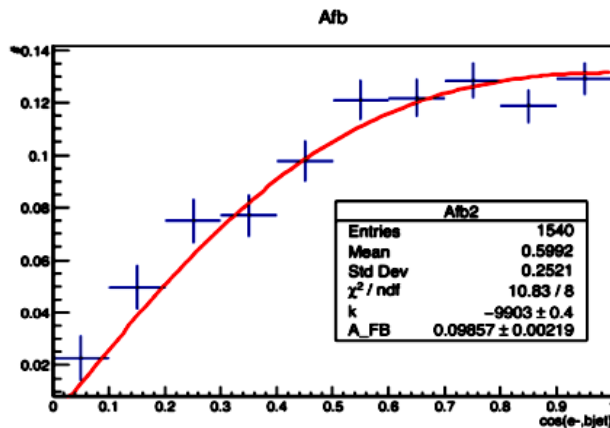

Examples of fits of reconstructed polar angle Q_F, Q_B distributions (tune= 7)

ALEPH-2001

DELPHI-2005

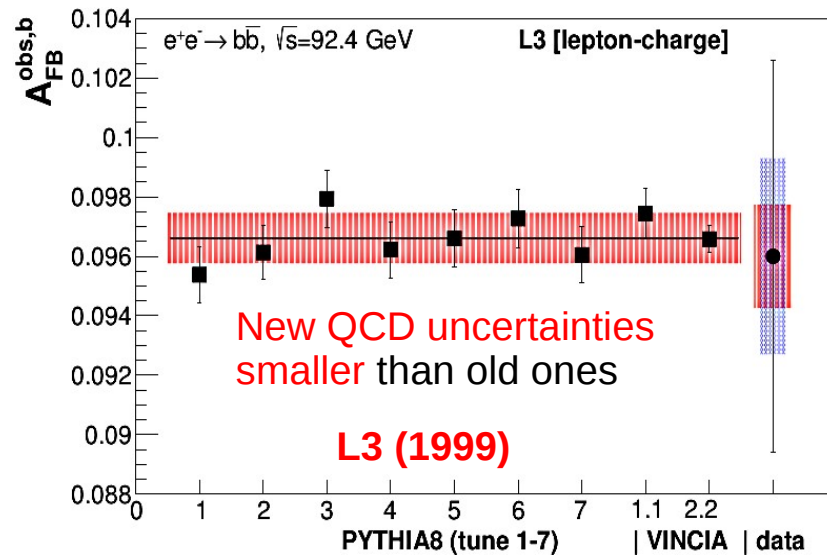

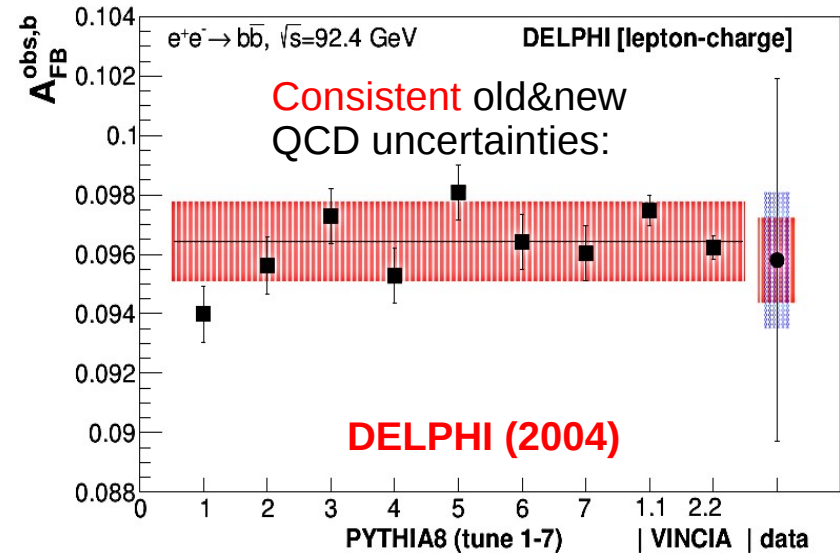

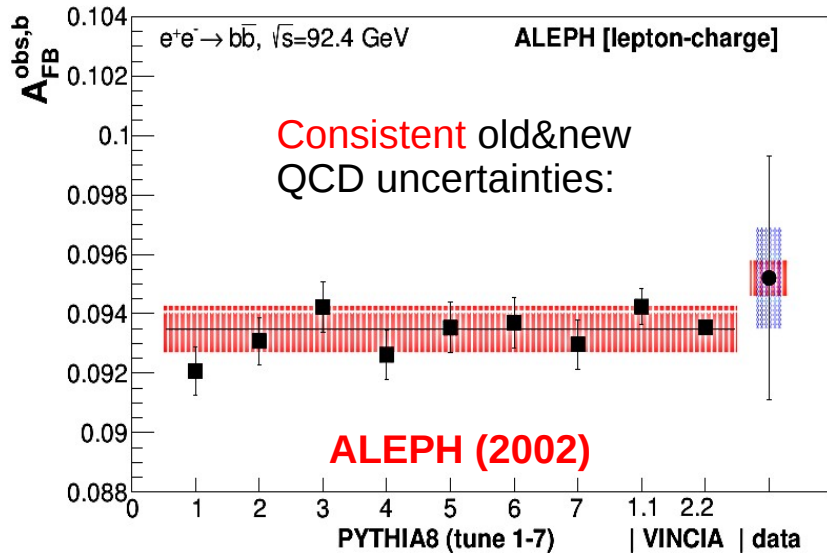

L3-1998

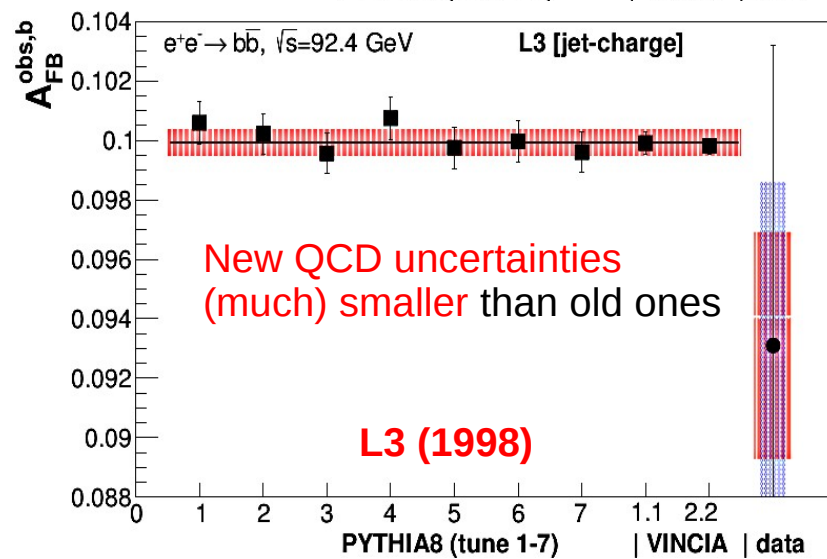

OPAL-2002

Lepton-based A_{FB}^b : QCD uncertainties

■ New average QCD uncertainties ~consistent with original ones

Jet-charge-based A_{FB}^b : QCD uncertainties

■ Smaller average uncertainties than lepton-based analysis.

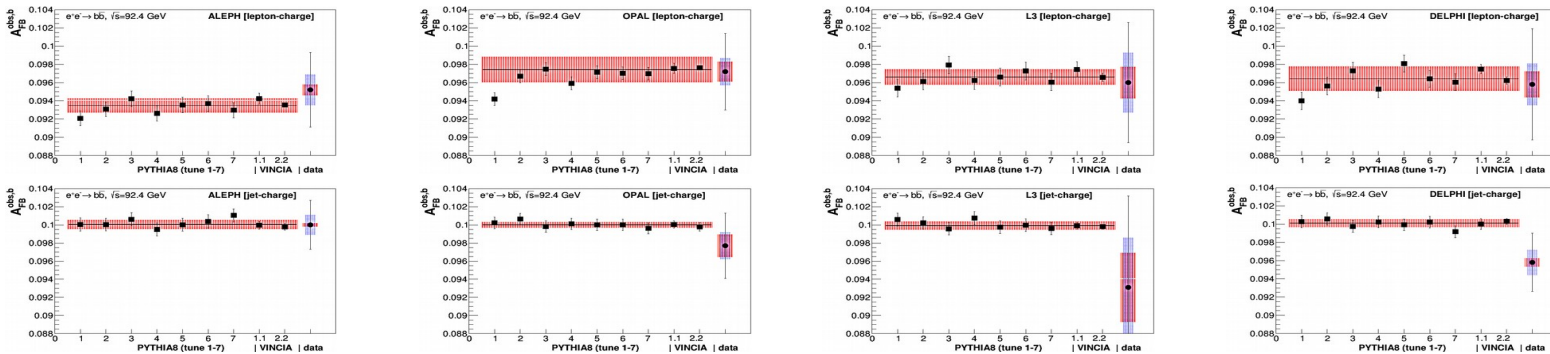

New QCD uncertainties consistent or smaller than original ones

Summary

- Forward-backward asymmetry of b-quarks in $e^+e^- \rightarrow Z(bb)$ shows **largest TH-EXP discrepancy** today among EWPO: $A_{FB} = 0.0992 \pm 0.0016$ (2.8σ from th.: 0.1037 ± 0.0008)

- Dominant **systematic uncertainties due to QCD** effects (parton shower, hadronization) have **not been cross-checked in 20 years**.
- Reanalysis of QCD uncertainties with **modern PS (PY8, PY8+VINCIA)**:

- New QCD uncertainties consistent (slightly smaller) with old ones. Jet-based more precise than lepton-based extraction. Updated $A_{FB} = 0.0996 \pm 0.0015$**
- Ongoing sim. with $\times 100$ times more stats. to “approach” FCC-ee conditions. **FCC-ee QCD b-jet fragmentation studies** needed to further reduce uncertainty.
