

# Analysis of loss plane

**B.Salvachua**  
**CERN BE/OP**

**BLM Thresholds Working Group**  
**15 May 2018**

# Introduction

## Loss spikes and fast drops of lifetime are a concern for operating machine

- ↪ Beam lifetime is used as an indication of the machine performance
- ↪ Monitor of beam quality along the LHC
- ↪ Optimise working (tune, chromaticity, octupoles) in collisions and MDs

# Introduction

## Loss spikes and fast drops of lifetime are a concern for operating machine

- ↪ Beam lifetime is used as an indication of the machine performance
- ↪ Monitor of beam quality along the LHC
- ↪ Optimise working (tune, chromaticity, octupoles) in collisions and MDs

$$\tau = \frac{I}{dI/dt} \quad \text{Beam lifetime}$$

$$\frac{dI}{dt} = R_{\text{loss}} \quad \text{Beam loss rate}$$

# Beam Lifetime Measurement

# Beam Lifetime Measurement

**Beam lifetime** (*absolute calibration*) is monitored using the measured beam current from the **BCT**. However, this method requires **smoothing with large times** ~ few seconds. Not ideal to measure beam losses.

# Beam Lifetime Measurement

**Beam lifetime** (*absolute calibration*) is monitored using the measured beam current from the **BCT**. However, this method requires **smoothing with large times**  $\sim$  few seconds. Not ideal to measure beam losses.

# Beam Lifetime Measurement

**Beam lifetime** (*absolute calibration*) is monitored using the measured beam current from the **BCT**. However, this method requires **smoothing with large times**  $\sim$  few seconds. Not ideal to measure beam losses.

A reduction of noise in the BCT signal will be very useful. Already the ADC24BIT of BCTDC has improved significantly the lifetime calculation but it contains a smoothing of the signal that depends on the time structure of the losses.

# Beam Lifetime Measurement

A reduction of noise in the BCT signal will be very useful. Already the ADC24BIT of BCTDC has improved significantly the lifetime calculation but it contains a smoothing of the signal that depends on the time structure of the losses.

**Other devices such as beam loss monitors could be used for this measurement and have additional advantages for the measurement of the proton loss rate.**

# Beam Loss Measurement

# Beam Loss Measurement

Assuming that **primary losses** occur at the collimators

# Beam Loss Measurement

Assuming that **primary losses occur at the collimators**

**We could use the BLMs** downstream each collimator to have a **direct measurement of the beam primary losses**, more precise and they can give **extra information**, i.e. loss plane, time structure, etc.

# Beam Loss Measurement

Assuming that **primary losses occur at the collimators**

**We could use the BLMs** downstream each collimator to have a **direct measurement of the beam primary losses**, more precise and they can give **extra information**, i.e. loss plane, time structure, etc.

BLMs are **more sensitive to losses** than the BCT (better signal-to-noise ratio) and have a wide range of integration times. Up to know we use 1.3s RS as this was relevant for collimation.

# BLM Calibration: Decomposition

# BLM Calibration: Decomposition

Select very well loss pattern scenarios: HORIZONTAL, VERTICAL, OFF - MOMENTUM

# BLM Calibration: Decomposition

Select very well loss pattern scenarios: HORIZONTAL, VERTICAL, OFF - MOMENTUM

Apply a singular value decomposition to the scenario matrix and calculate the Moore- Penrose pseudo-inverse. This enables the determination of the contributions from different loss scenarios.

# BLM Calibration: Decomposition

Select very well loss pattern scenarios: HORIZONTAL, VERTICAL, OFF - MOMENTUM

Apply a singular value decomposition to the scenario matrix and calculate the Moore- Penrose pseudo-inverse. This enables the determination of the contributions from different loss scenarios.

Many work: selection of BLMs, normalisation and getting good set of data.

# BLM Calibration: Decomposition

Select very well loss pattern scenarios: HORIZONTAL, VERTICAL, OFF - MOMENTUM

Apply a singular value decomposition to the scenario matrix and calculate the Moore- Penrose pseudo-inverse. This enables the determination of the contributions from different loss scenarios.

Many work: selection of BLMs, normalisation and getting good set of data.

Dedicated **scraping at top energy with separated beams** was needed and the test was scheduled at the end of October 2017

HORIZONTAL

VERTICAL

OFF-MOMENTUM

# Using the matrix

$$\begin{array}{ccc} \text{Result} & \text{Matrix} & \text{BLM} \\ & & \text{measurements} \\ \left( \begin{array}{c} \text{B1H} \\ \text{B1V} \\ \text{B2H} \\ \text{B2V} \\ \text{B1 off mom.} \\ \text{B2 off mom.} \end{array} \right) & = & \left( \begin{array}{c} \dots \\ \text{BLM 1} \\ \text{BLM 2} \\ \vdots \end{array} \right) \end{array}$$

## 1. Quantify protons lost and loss plane:

1. during specific MDs: long range, wire collimator, ATS, etc.
2. During the LHC cycle to assess the performance or study limitation.  
Example tune shift 2017 B1V.

# Different Crossing Angles at LHC

Impact of different crossing angles were tested in different MDs in order to explore the limitation due to long range beam-beam effects.

A train of 144 bunches colliding ATLAS/CMS

Half-Crossing from 185-90  $\mu$ rad Both ATLAS/CMS

Observed that losses only in Beam 1, mainly in the Vertical Plane

30/07/2016 Time (HH:MM)

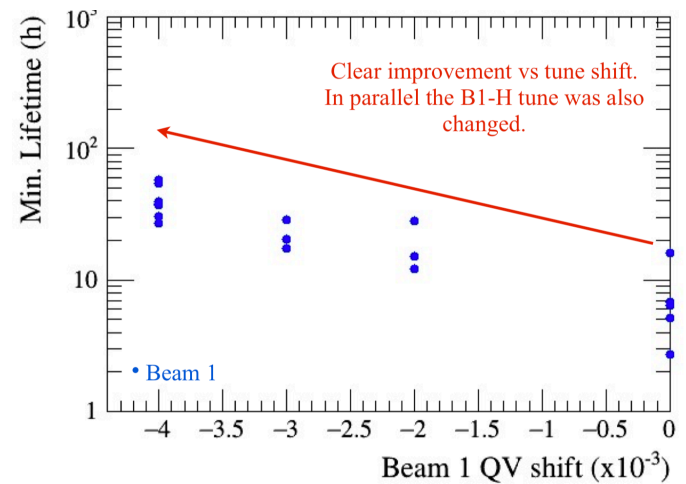

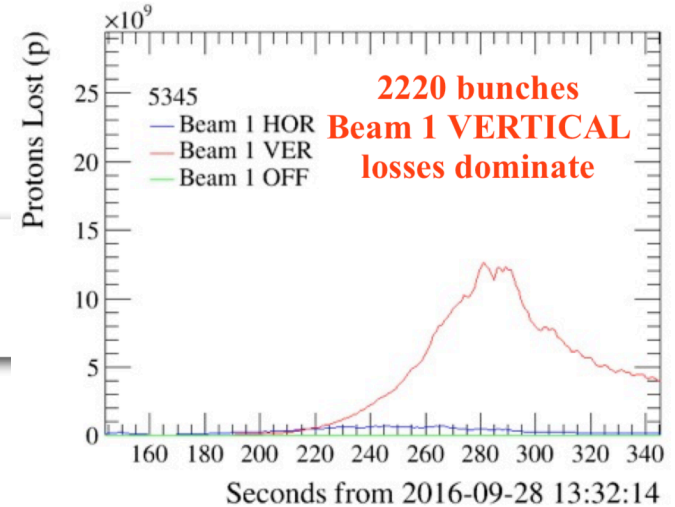

IPAC 2017 B.Salvachua et al.

# LRBB test 2017

- Beam test using wires installed in collimators to compensate the octupolar term of the beam-beam in IR5.
- There was an initial B2H blow-up, followed by additional losses in B2H as the wires were switched on and off.
- The ML algorithm correctly classified the 3 spikes in losses which were  $\sim 1e8$  p. There was one misclassification (though here the losses in B1 and B2 are  $\sim$ equal &  $\sim 1e7$  p).

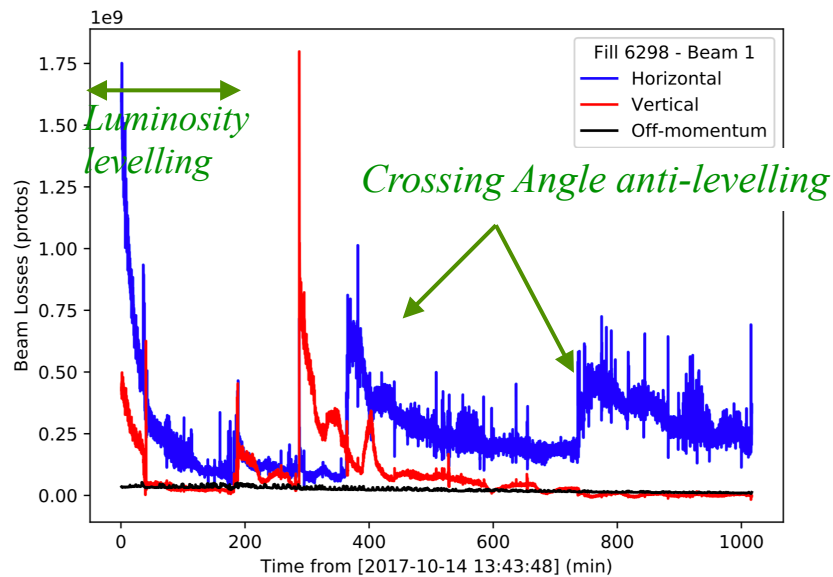

# Losses Squeeze 2016

# Breakdown of losses in SB 2017

Applying the **BLM calibration** and decomposition we could **quantify the NON burn off losses**. It confirms that losses in Beam 1 are about a factor of 2 higher than for Beam 2.

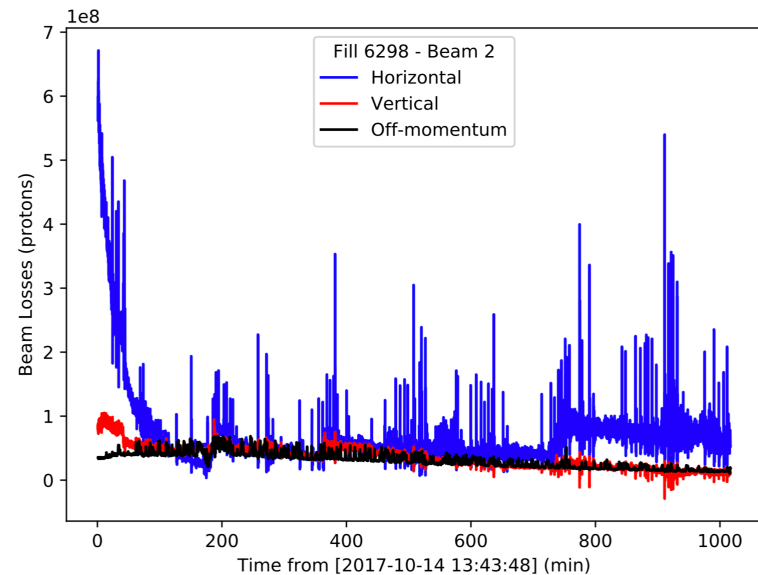

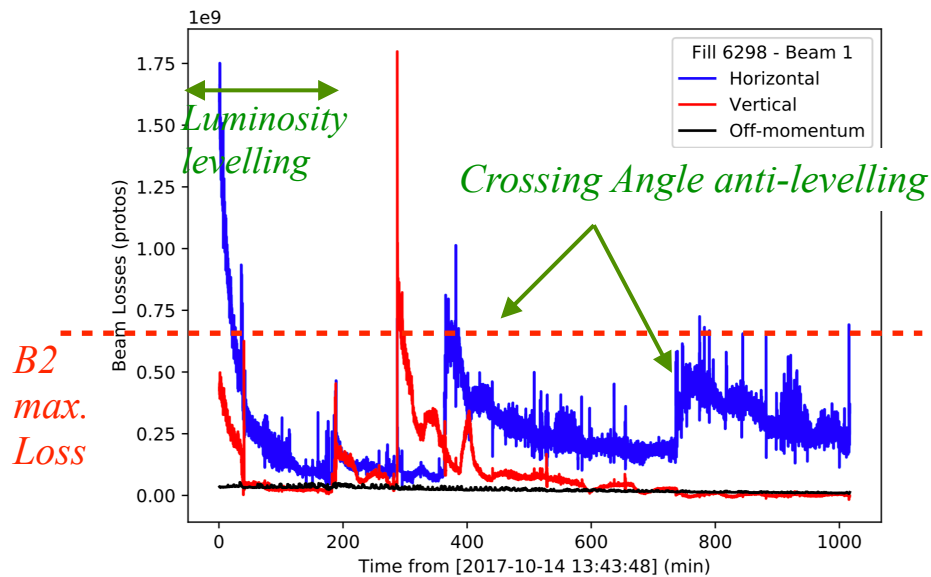

- Losses occur in the Horizontal and Vertical plane, depending on the fill analysed.
- Off-momentum losses have a small contribution.
- Loss steps are correlated with changes of crossing angle (Horizontal plane) and optimisations.

# Breakdown of losses in SB 2017

Applying the **BLM calibration** and decomposition we could **quantify the NON burn off losses**. It confirms that losses in Beam 1 are about a factor of 2 higher than for Beam 2.

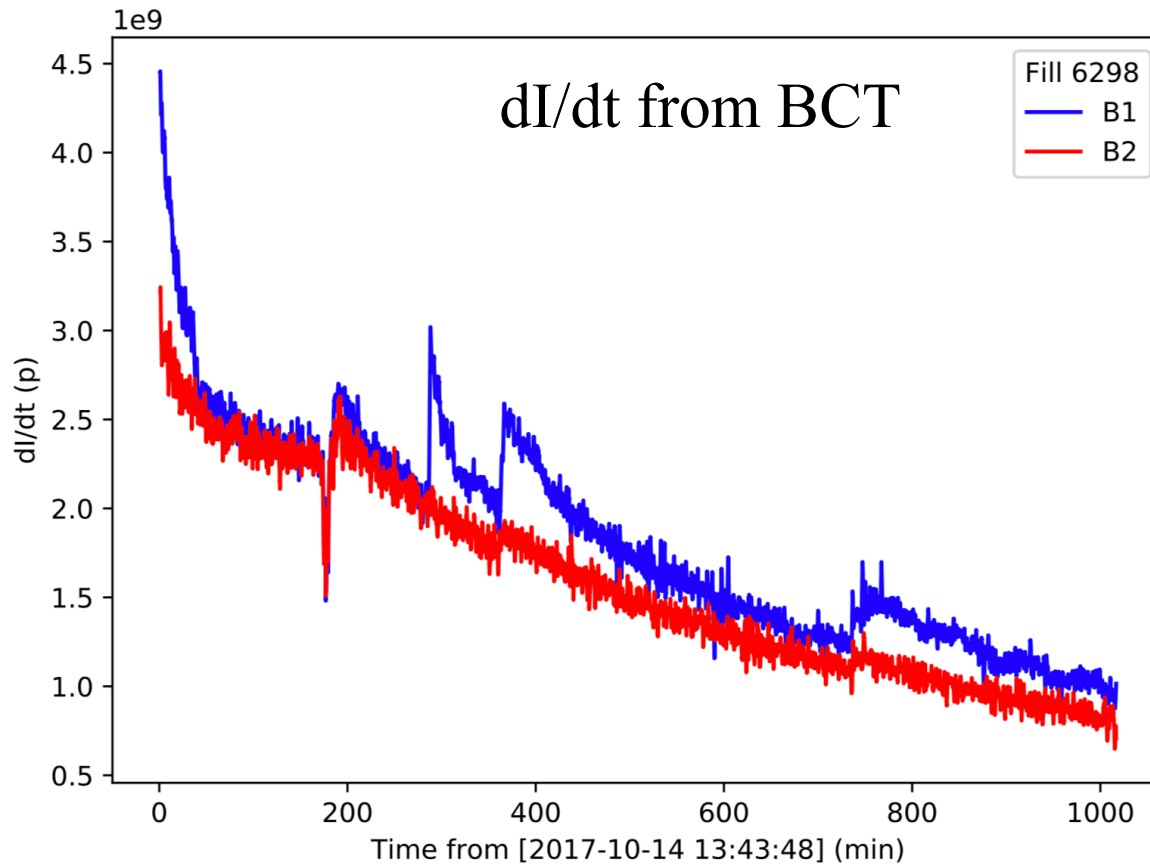

- Losses occur in the Horizontal and Vertical plane, depending on the fill analysed.
- Off-momentum losses have a small contribution.
- Loss steps are correlated with changes of crossing angle (Horizontal plane) and optimisations.

# Luminosity losses

$dI/dt$  from BCT where Beam 1 lifetime is worse than Beam 2

# Luminosity losses

**dI/dt from BCT removing the contribution from collimators**

*losses measured by the BLMs calibrated with decomposition matrix*

Now the beam lifetime from Beam 1 and Beam 2 is exactly the same because it comes only from luminosity. → **Proton losses well quantified**

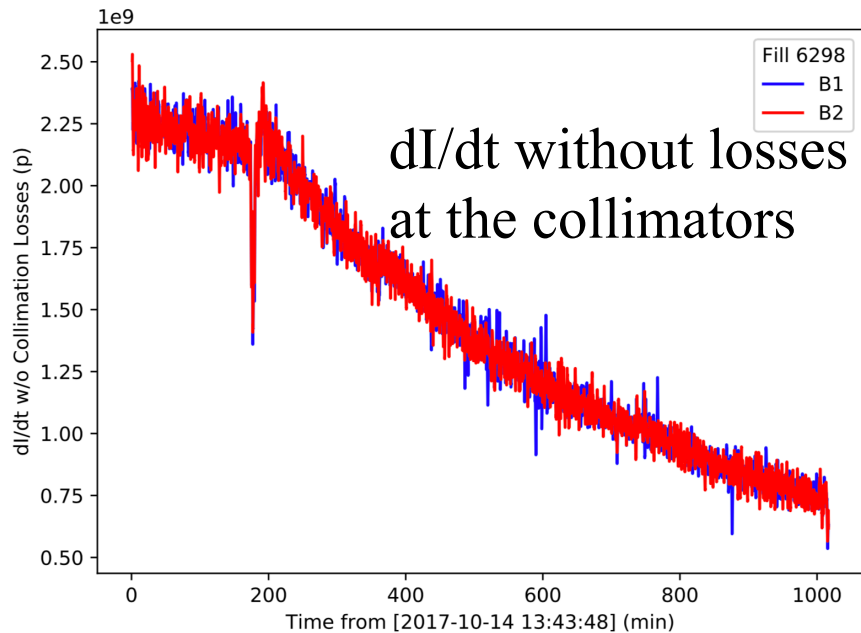

# Luminosity losses

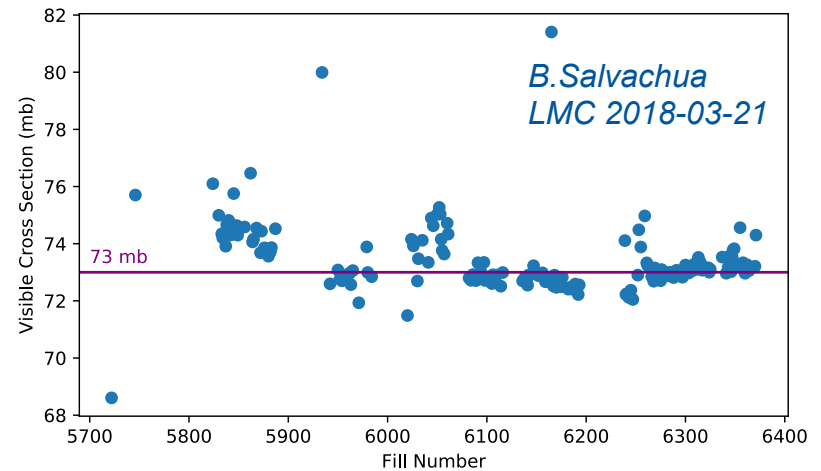

**dI/dt from BCT removing the contribution from collimators**

*losses measured by the BLMs calibrated with decomposition matrix*

Now the beam lifetime from Beam 1 and Beam 2 is exactly the same because it comes only from luminosity. → **Proton losses well quantified**

$$\frac{dI}{dt} = \frac{dI}{dt} \Big|_{loss} + \mathcal{L} \cdot \sigma_{inelastic}$$

$$\sigma_{inel} = \sigma_{visible} + \sigma_{correction}$$

$$\sigma_{inel} = 72.9 + 5.55 = 78.5 \text{ mb}$$

6.5TeV measured at the LHC (BCT-BLM)

# Fill by fill analysis - I

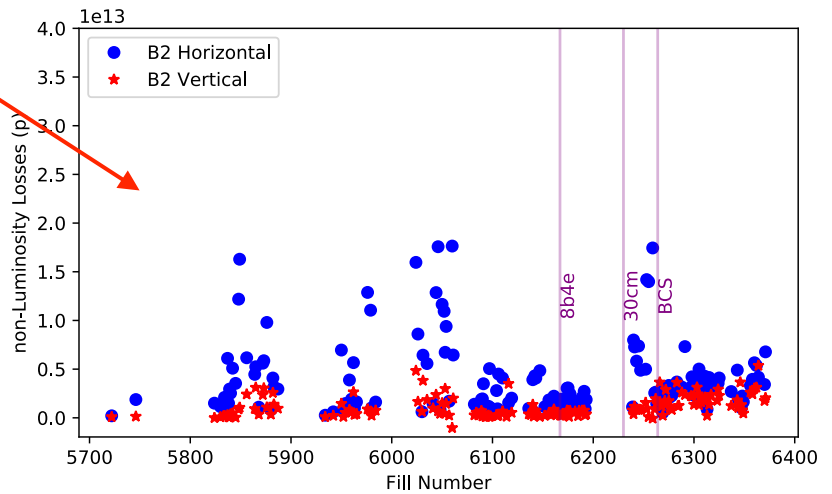

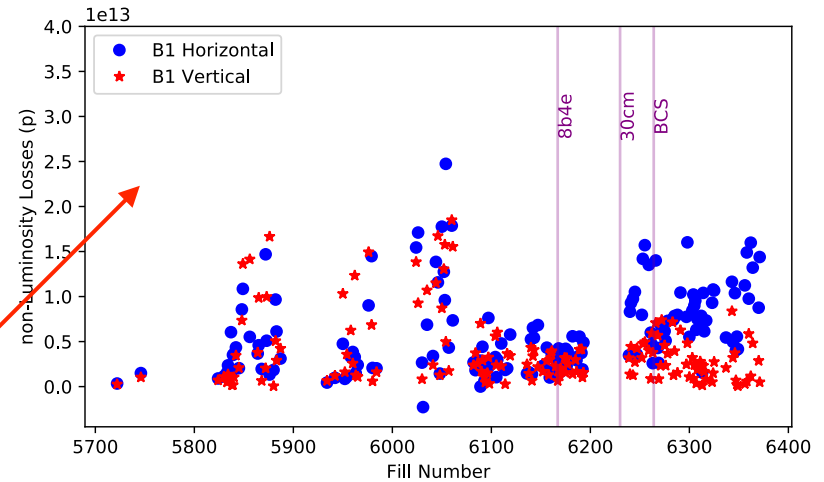

Integrated  $dI/dt$  without collimation losses, no cross section assumption is done here. The calculation comes ONLY from BCT and BLMs.

- **(LEFT)** Both Beam 1 and Beam 2 have the same amount of protons lost not at the collimators  $\rightarrow$  expected as burn off losses. Differences between fills are due to different peak luminosity and fill length.
- **(RIGHT)** Beam 1 has more losses at the collimators as observed.

# Fill by fill analysis - II

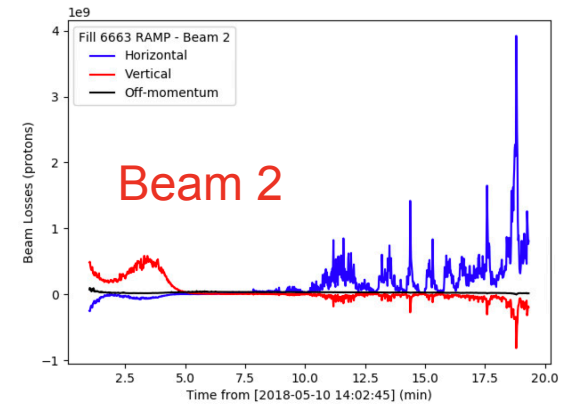

Here we take the non-luminosity losses and we see the amount lost in Horizontal plane (blue) and the amount lost in Vertical plane (red)

# 2018 losses

The calibration on 2017 data was applied to 2018 and results are still very accurate, although a dedicated calibration fill will be needed to check calibration and to apply a similar approach for the dBLM detectors.

## Losses during the RAMP 2018

## Losses during the SQUEEZE 2018

# Summary

- **Improved BLM calibration** to calculate protons lost and **beam lifetime with 2017 configuration.**
- Simple calibration for online diagnostic
- Decomposition matrix for offline analysis: identification of loss plane, horizontal, vertical and off-momentum

Thank you!
