

# Computing infrastructure, data acquisition and data processing in HEP from experiments

**Vladimir Korenkov**  
**(JINR, University “Dubna”)**

**CERN, 04.11.09**

# Laboratory of Information Technologies

# Specific tasks:

1. Provision of JINR and its Member States with high-speed telecommunication data links
2. Creation of a high-speed, reliable and protected local area network (LAN) of JINR
3. Creation and maintenance of the distributed high-performance computing infrastructure and mass storage resources
4. Provision of information, algorithmic and software support of the JINR research-and-production activity
5. Elaboration of the JINR Grid-segment and its inclusion in European and global Grid-structures
6. Methods and tools for modeling physical processes and experimental data analysis
7. Methods and numerical algorithms for modeling magnetic systems and charged particle beam transport
8. Software and computer complexes for experimental data processing
9. Numerical algorithms and software for the simulation of complex physical systems
10. Methods, algorithms and software of computer algebra
11. New generation computing tools

# LIT JINR: two important projects completed

Two large-scale very important projects have been completed.

A grand presentation was held simultaneously with the meeting of the Programme Advisory Committee for Particle Physics on June 10.

All organizations involved in the projects realisation together with the representatives of Ministry of Communications, Federal Agency for Science and Innovation attended the Presentation.

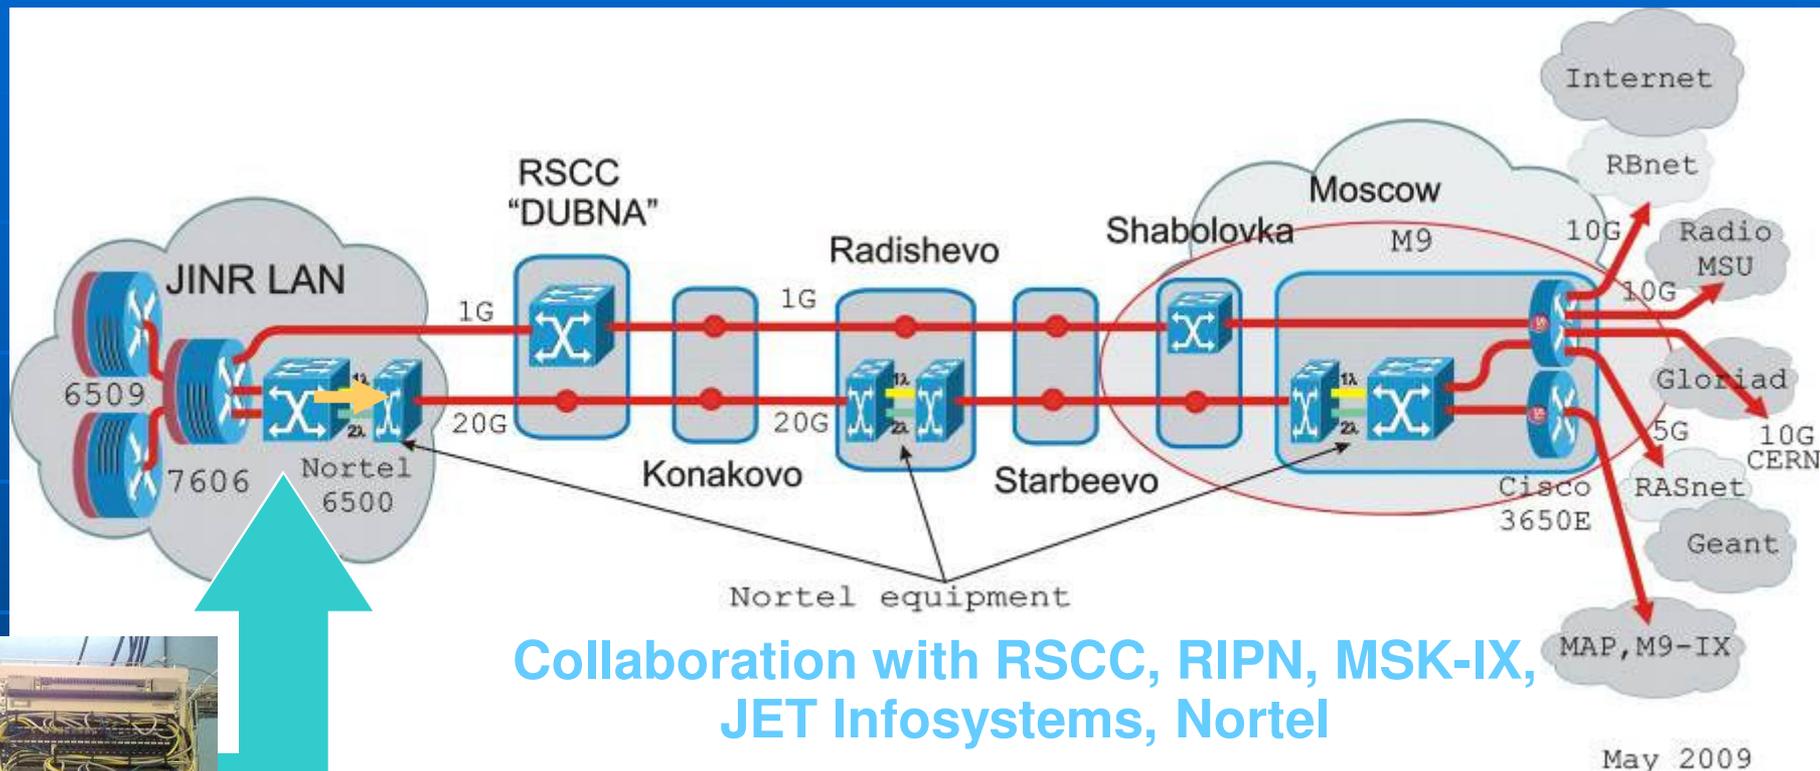

Our community colleagues and prospective users - residents of the special economical zone - were also invited.

T.Strizh

SUPER MICRO COMPUTER INC.

# Локальная сеть ОИЯИ

JINR Local Area Network and telecommunication channels

- **Comprises 7488** computers and nodes  
Users - 4669  
Remote VPN users – more 2000;
- **High-speed transport (1Gbps);**
- 

## Планы

*Поэтапная модернизация локальной сети ОИЯИ на основе технологии 10 G Ethernet*

*Развитие системы управления информационными потоками и механизмов информационной безопасности*

# GÉANT2 Pan-European Backbone

**34 NRENs, ~30M Users; 50k km Leased Lines  
12k km Dark Fiber; Point to Point Services  
GN3 Next Gen. Network Projected Start Q2 2009**

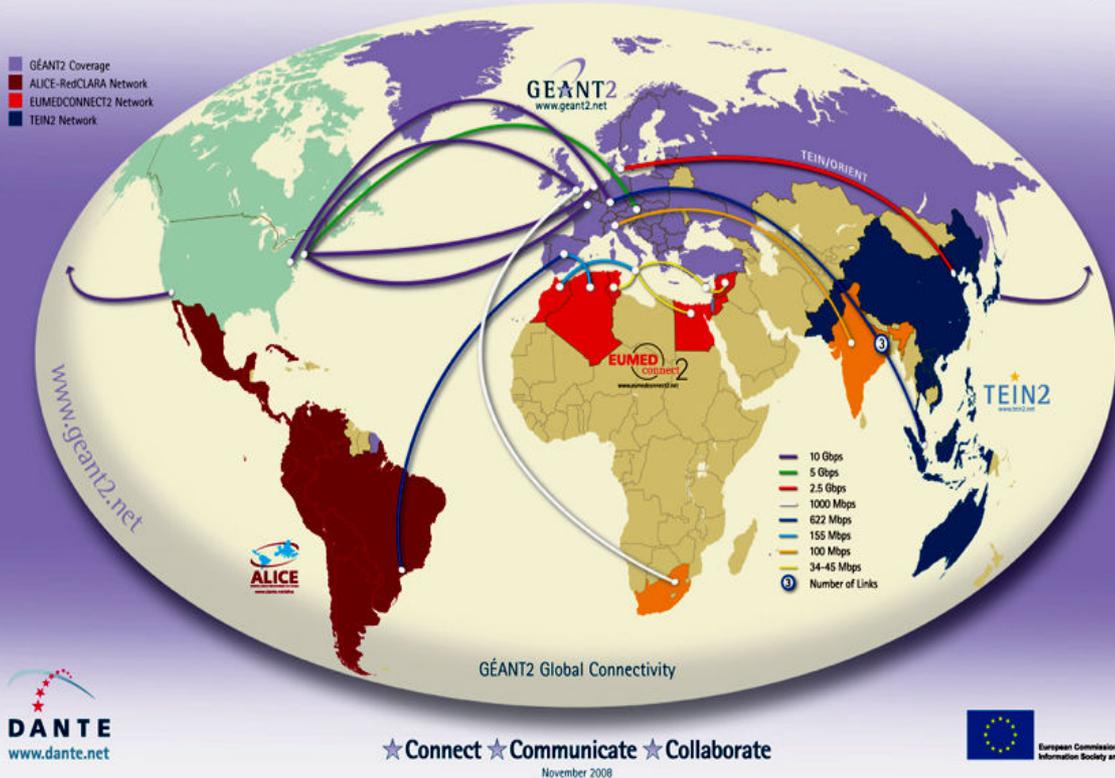

## Dark Fiber Core Among 19 Countries:

- ◆ Austria
- ◆ Belgium
- ◆ Croatia
- ◆ Czech Republic
- ◆ Denmark
- ◆ Finland
- ◆ France
- ◆ Germany
- ◆ Hungary
- ◆ Ireland
- ◆ Italy
- ◆ Netherlands
- ◆ Norway
- ◆ Slovakia
- ◆ Slovenia
- ◆ Spain
- ◆ Sweden
- ◆ Switzerland
- ◆ United Kingdom

# GEANT2 International Connectivity

GEANT2 At the Heart of Global Research Networking

## Inter-Regional Connections

- ◆ GEANT2/ESNet over US LHCNet for US Tier2/ EU Tier1 Connections
- ◆ 4 10G Links to US R&E Nets
- ◆ 1 GbE Connection to the Ubuntunet Alliance (Africa); also TENET in South Africa
- ◆ ORIENT: CERNET + CSTNET (China) to Europe at 2.5G
- ◆ TEIN2: 9 Asian Countries + Australia to Europe; TEIN3 Approved 2008-2011
- ◆ EUMEDConnect: 11 Mediterranean + N. Africa
- ◆ ALICE: 12 Latin American countries to GEANT2 at 622 Mbps
- ◆ SuperSINET (Japan) at New York: 10G
- ◆ India: 100 Mbps

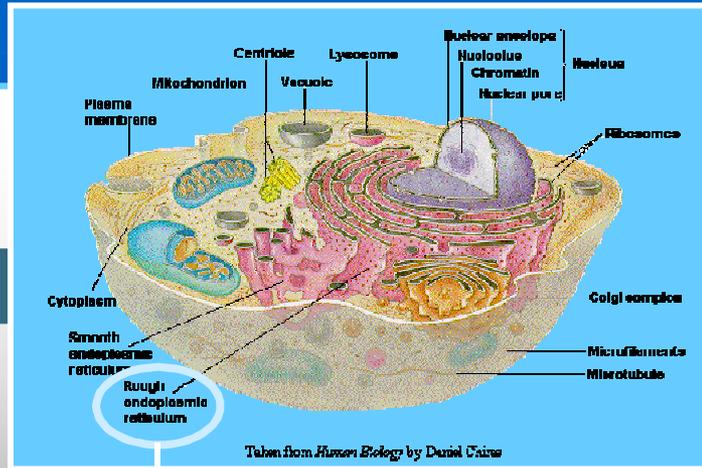

## New Projects in 2008-9

- ◆ ALICE2 in and to Latin America
- ◆ CAREN for Central Asia
- ◆ FEAST: Feasibility Study for Sub-Saharan Africa

# Real World Problems Taking Us BEYOND PETASCALE

1 ZFlops

# A look at CERN's Computing Growth

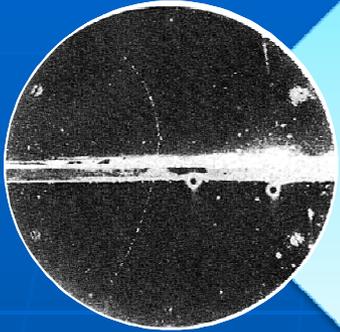

# We do *e-Science*

- “e” like in e-mail:
  - digital, distributed
- Science that is:
  - Computationally intensive
  - Operates on massive digital data sets
  - Carried out in a distributed network environment
- High-**Throughput** vs High-Performance Computing:
  - HTC: distributed (serial tasks), free cycles, cheap
  - HPC: compact (parallel tasks), booked years ahead, expensive
- High-Energy Physics is a textbook example of e-science

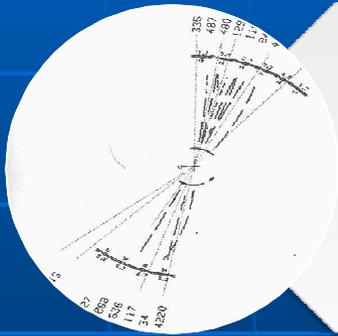

# New instruments, more data, more scientists, more computers

## A discovery in 1930-ies

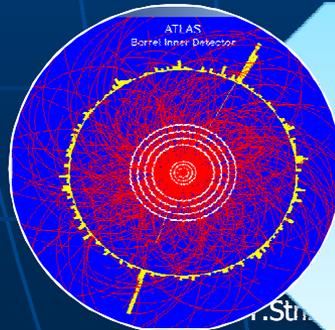

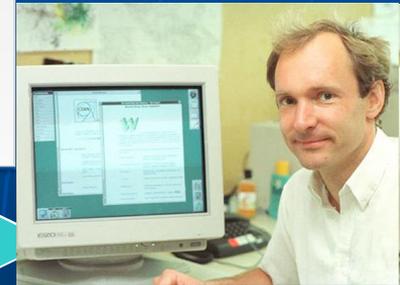

- ~2 scientists in 1 country
- pen-and-paper

## A discovery in 1970-ies

- ~200 scientists in ~10 countries
- mainframes

1989 - WWW born in CERN

## A discovery tomorrow

- ~2000 scientists in ~100 countries
- **grids**

# Modern HEP data processing: workflow of very different tasks

Monte Carlo

Event generation (*Pythia*)

Detector simulation (*Geant*)

Hit digitization

Reconstruction

Analysis data preparation

Analysis, results (*ROOT*)

# Software for HEP experiments

Massive pieces of software

- Written by very many different authors in different languages
- Dozens of external components

Frequent releases

- Occupy as much as  $\sim 10$  GB of disk space each release
- Releases can come as often as once a month

Difficult to set up outside the lab

- Software is often tuned to the specifics of one lab (e.g. CERN SLC4)

Unfeasible to be maintained locally by small university teams

- **Plan A: do everything centrally at the lab**
- **Plan B: use Grid to connect large external computing “plants” managed by teams of experts**

**Research/  
Discovery**

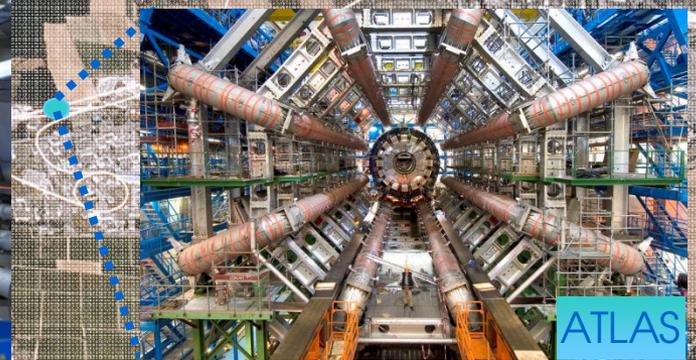

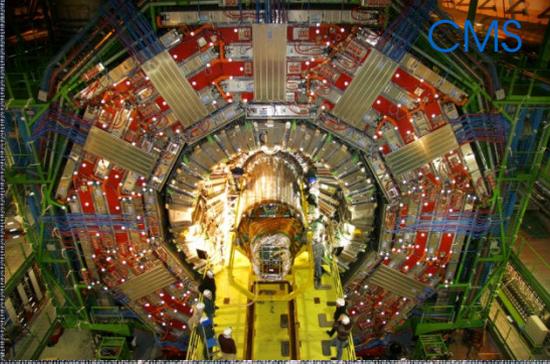

**Technology**

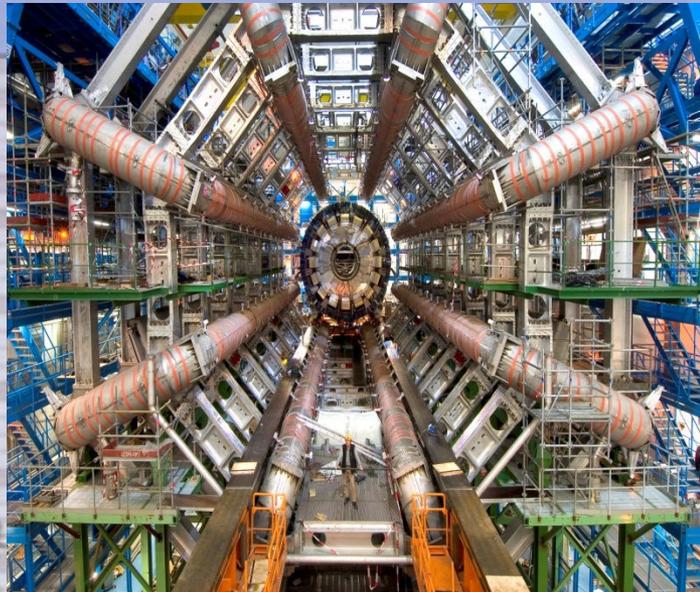

**Training**

**Collaborating**

# Large Hadron Collider

Start-up of the Large Hadron Collider (LHC), one of the largest and truly global scientific projects ever, is the most exciting turning point in particle physics.

***ATLAS superimposed to  
the CERN 5-floors building 40***

# Параметры детектора АТЛАС

Энергия центра масс 14 TeV

Частота столкновений пучков  
40 MHz

Светимость :

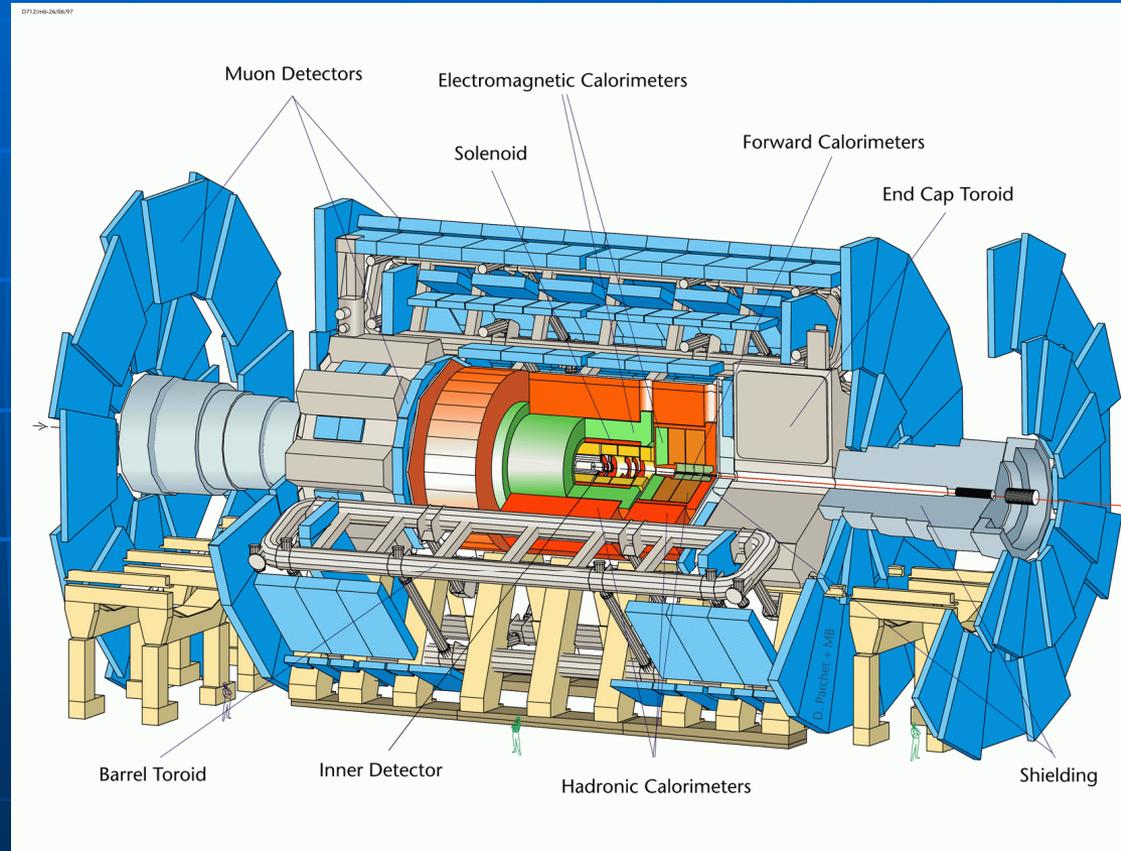

- начальная:  $10^{31} \text{ см}^{-2}\text{с}^{-1}$
- низкая:  $2 \cdot 10^{33} \text{ см}^{-2}\text{с}^{-1}$
- целевая:  $10^{34} \text{ см}^{-2}\text{с}^{-1}$

Вес 7000 тонн,

Диаметер 22м,

Длинна 46м

Количество регистрирующих  
каналов 140 000 000

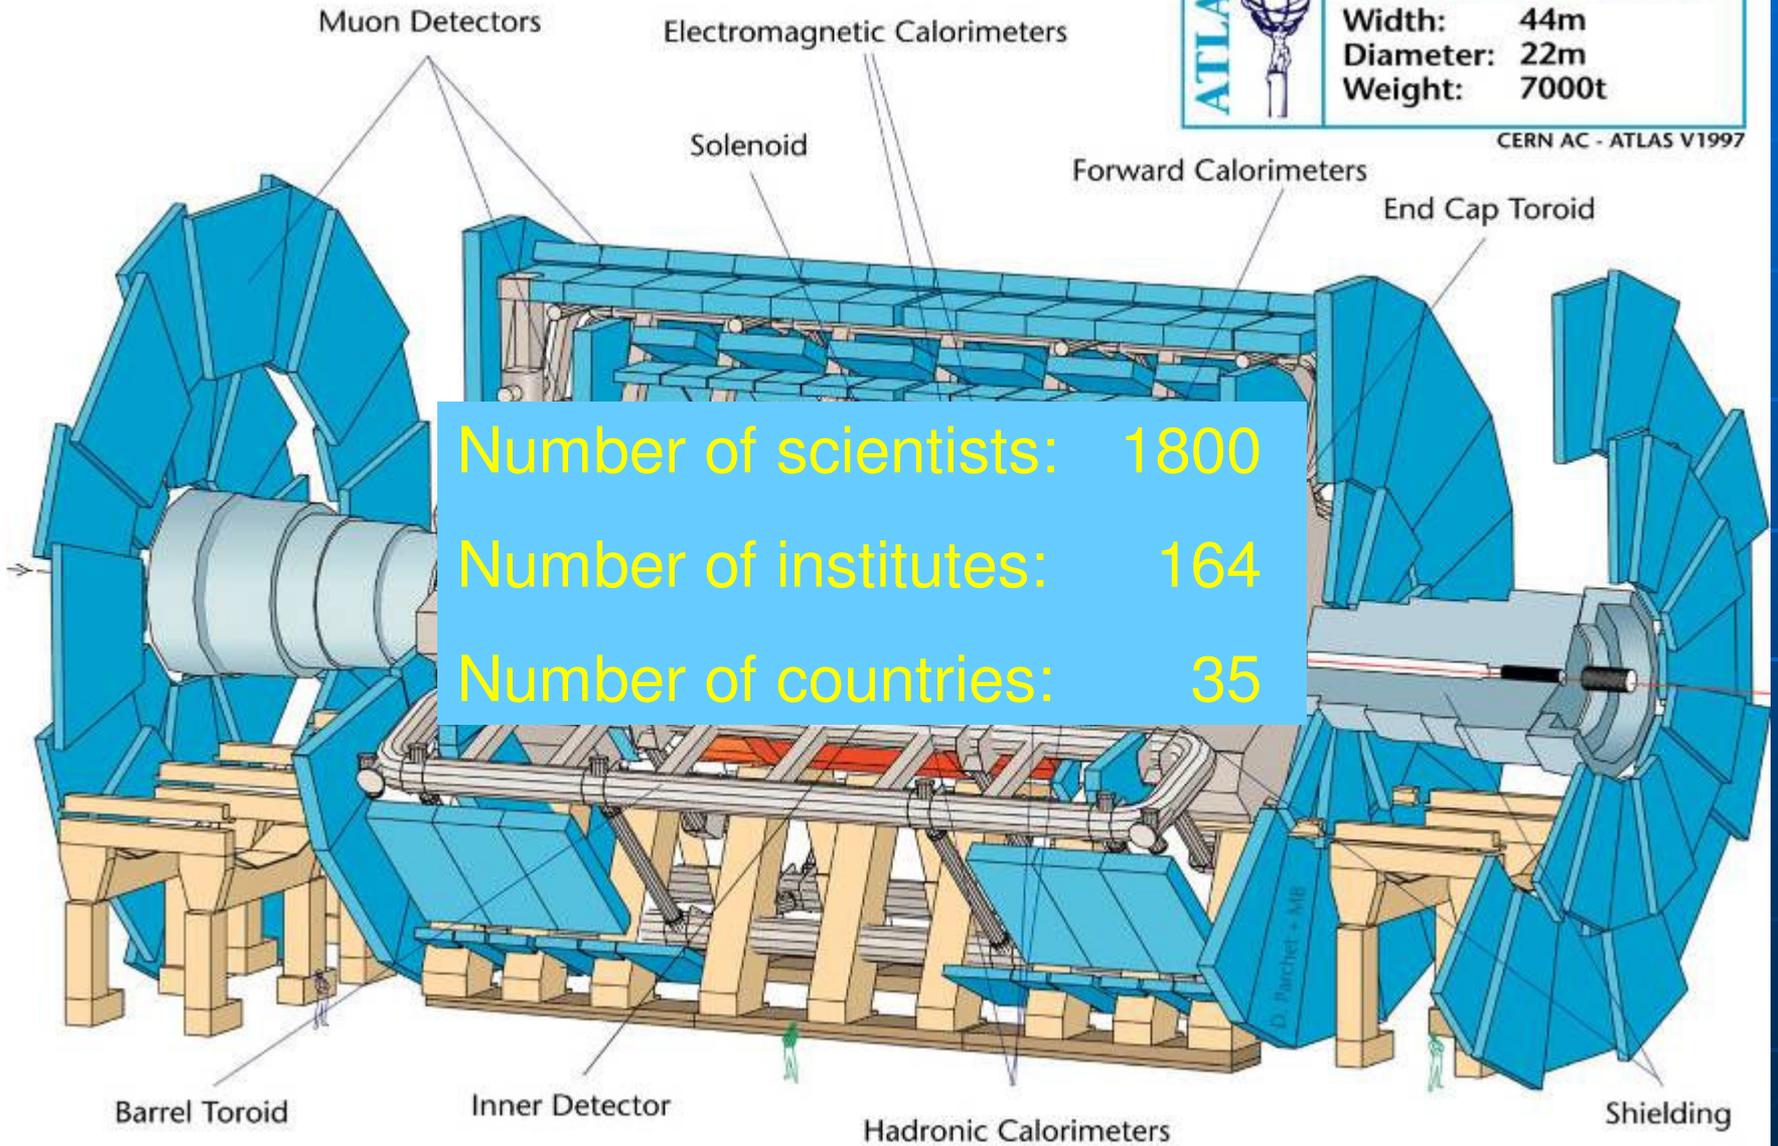

# ATLAS

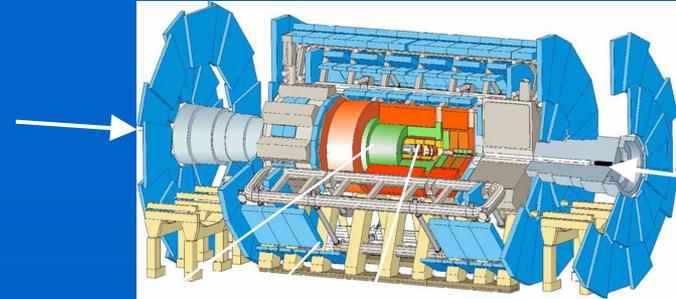

## Detector characteristics

**Width:** 44m  
**Diameter:** 22m  
**Weight:** 7000t

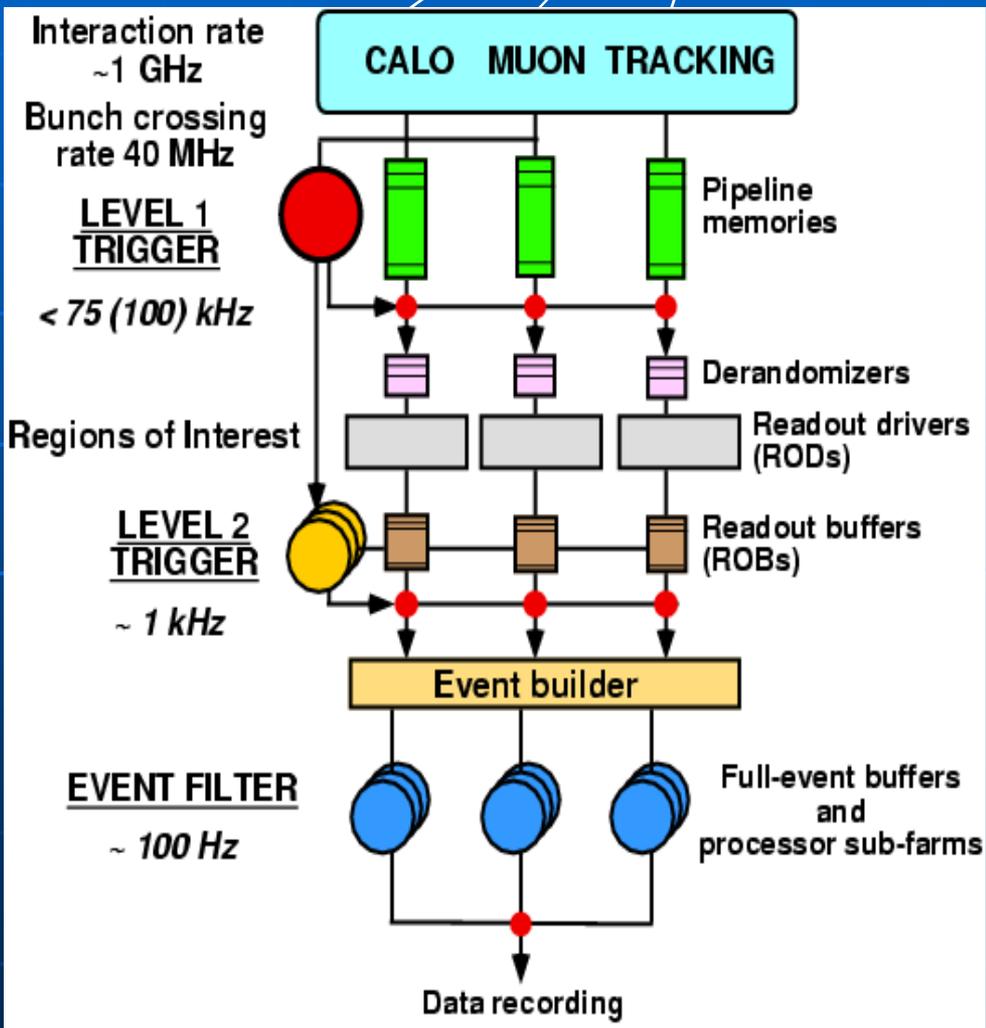

CERN AC - ATLAS V1997

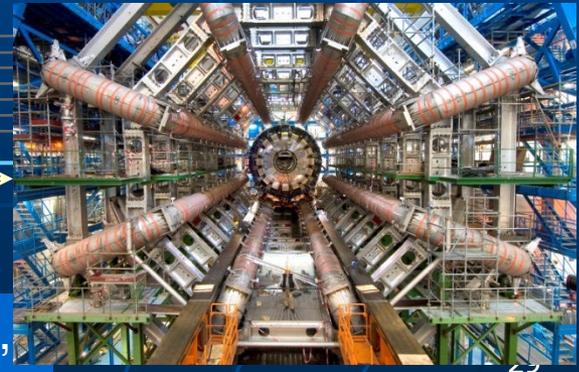

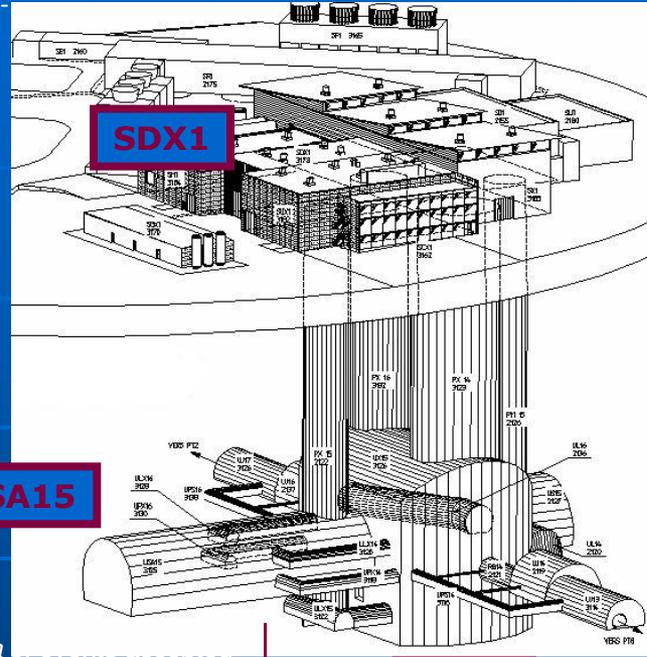

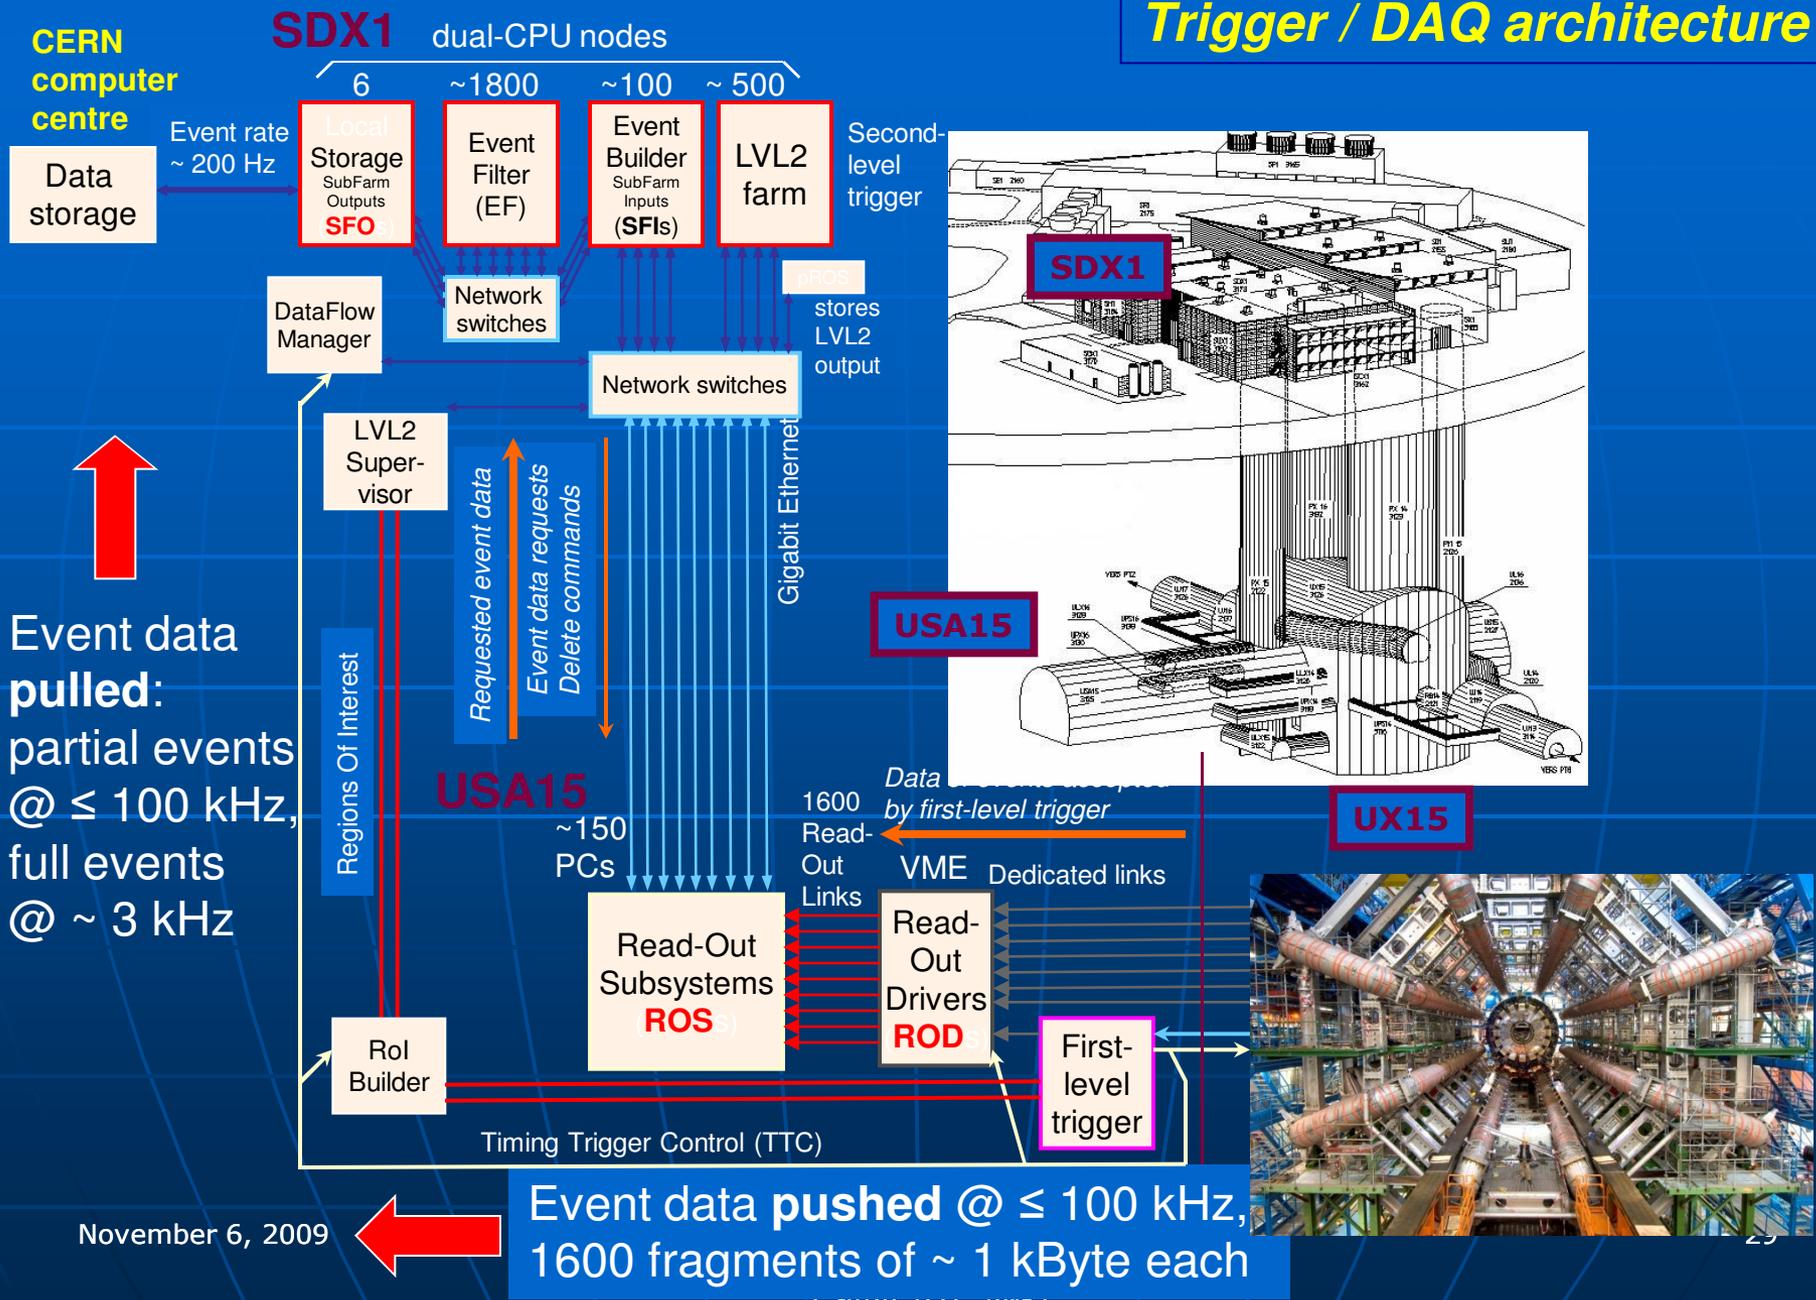

# Система Селекции и Сбора Данных

- Триггер 1-го уровня:
  - Сигналы с Калориметров и Мюонной системы
  - Частота событий на выходе  $\sim 75$  kHz
- Триггер 2-го уровня :
  - 500 компьютеров
  - Селекция на основе **"Region of Interest" (RoI)**
  - Специализированные быстрые алгоритмы
  - Время принятия решения 20 миллисекунд/событие
- Event Builder (EB):
  - 100 компьютеров
- Триггер 3-го уровня (Event Filter (EF)):
  - 2000 компьютеров
  - Стандартные оффлайн алгоритмы
  - Время принятия решения 2 секунды/событие

# Trigger / DAQ architecture

Event data pulled:  
partial events  
@  $\leq 100\text{ kHz}$ ,  
full events  
@  $\sim 3\text{ kHz}$

Event data pushed @  $\leq 100\text{ kHz}$ ,  
1600 fragments of  $\sim 1\text{ kByte}$  each

November 6, 2009

# HLT Farms

Final size for max L1 rate (*TDR*)

~ **500 PCs for L2** + ~ **1800 PCs for EF**

(multi-core technology)

**For 2008** : 850 PCs installed  
total of 27 XPU racks = 35% of final  
system

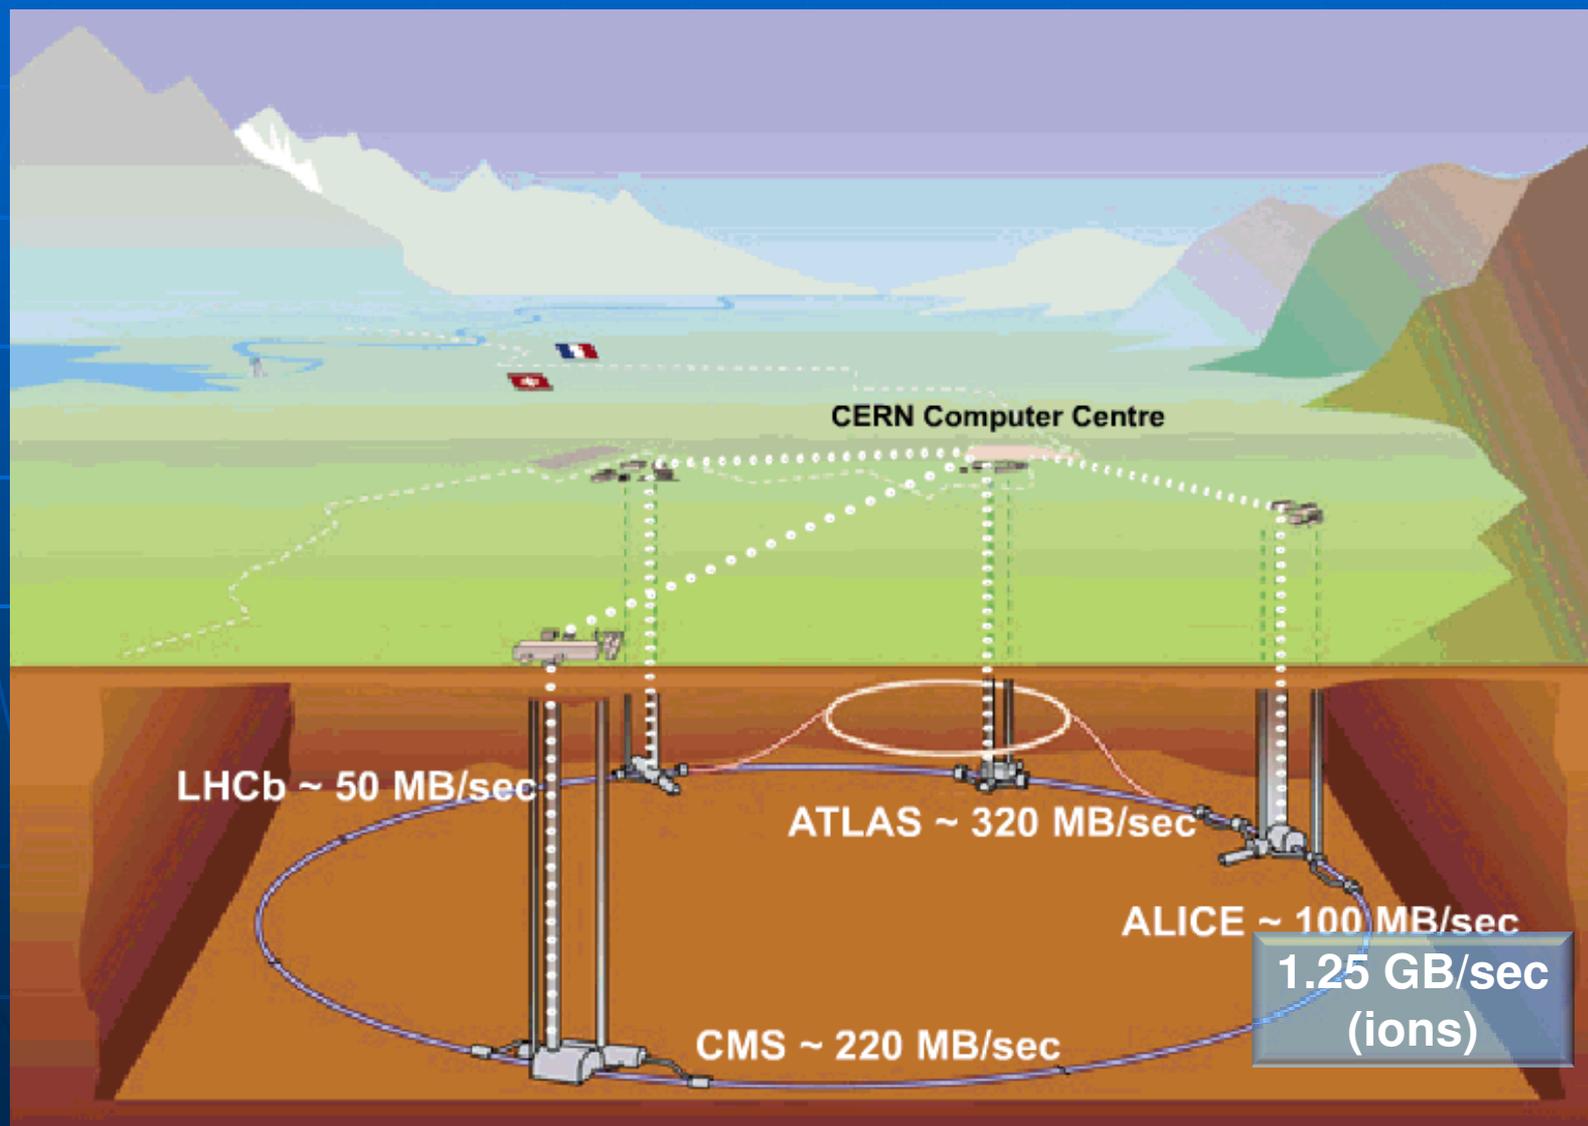

(1 rack = 31 PCs)

(XPU = can be connected to L2 or EF)

- **x 8 cores**
- **CPU: 2 x Intel Harpertown quad-core 2.5 GHz**
- **RAM: 2 GB / core, i.e. 16 GB**

**Final system** : total of 17 L2 + 62 EF racks  
of which **28 (of 79) racks as XPU**

# Потоки данных от физических установок БАК до вычислительного центра ЦЕРН (Tier 0 at CERN)

T2s and T1s are inter-connected by the general purpose research networks

- LHC experiments will produce **10-15 million Gigabytes** of data each year (about 20 million CDs!)
- LHC data analysis requires a computing power equivalent to **~100,000 of today's fastest PC processors.**

# Взаимодействие уровней Tier 0 – Tier 1 – Tier 2

## Tier-0 (CERN):

- Прием данных
- Начальная реконструкция данных
- Распределение данных

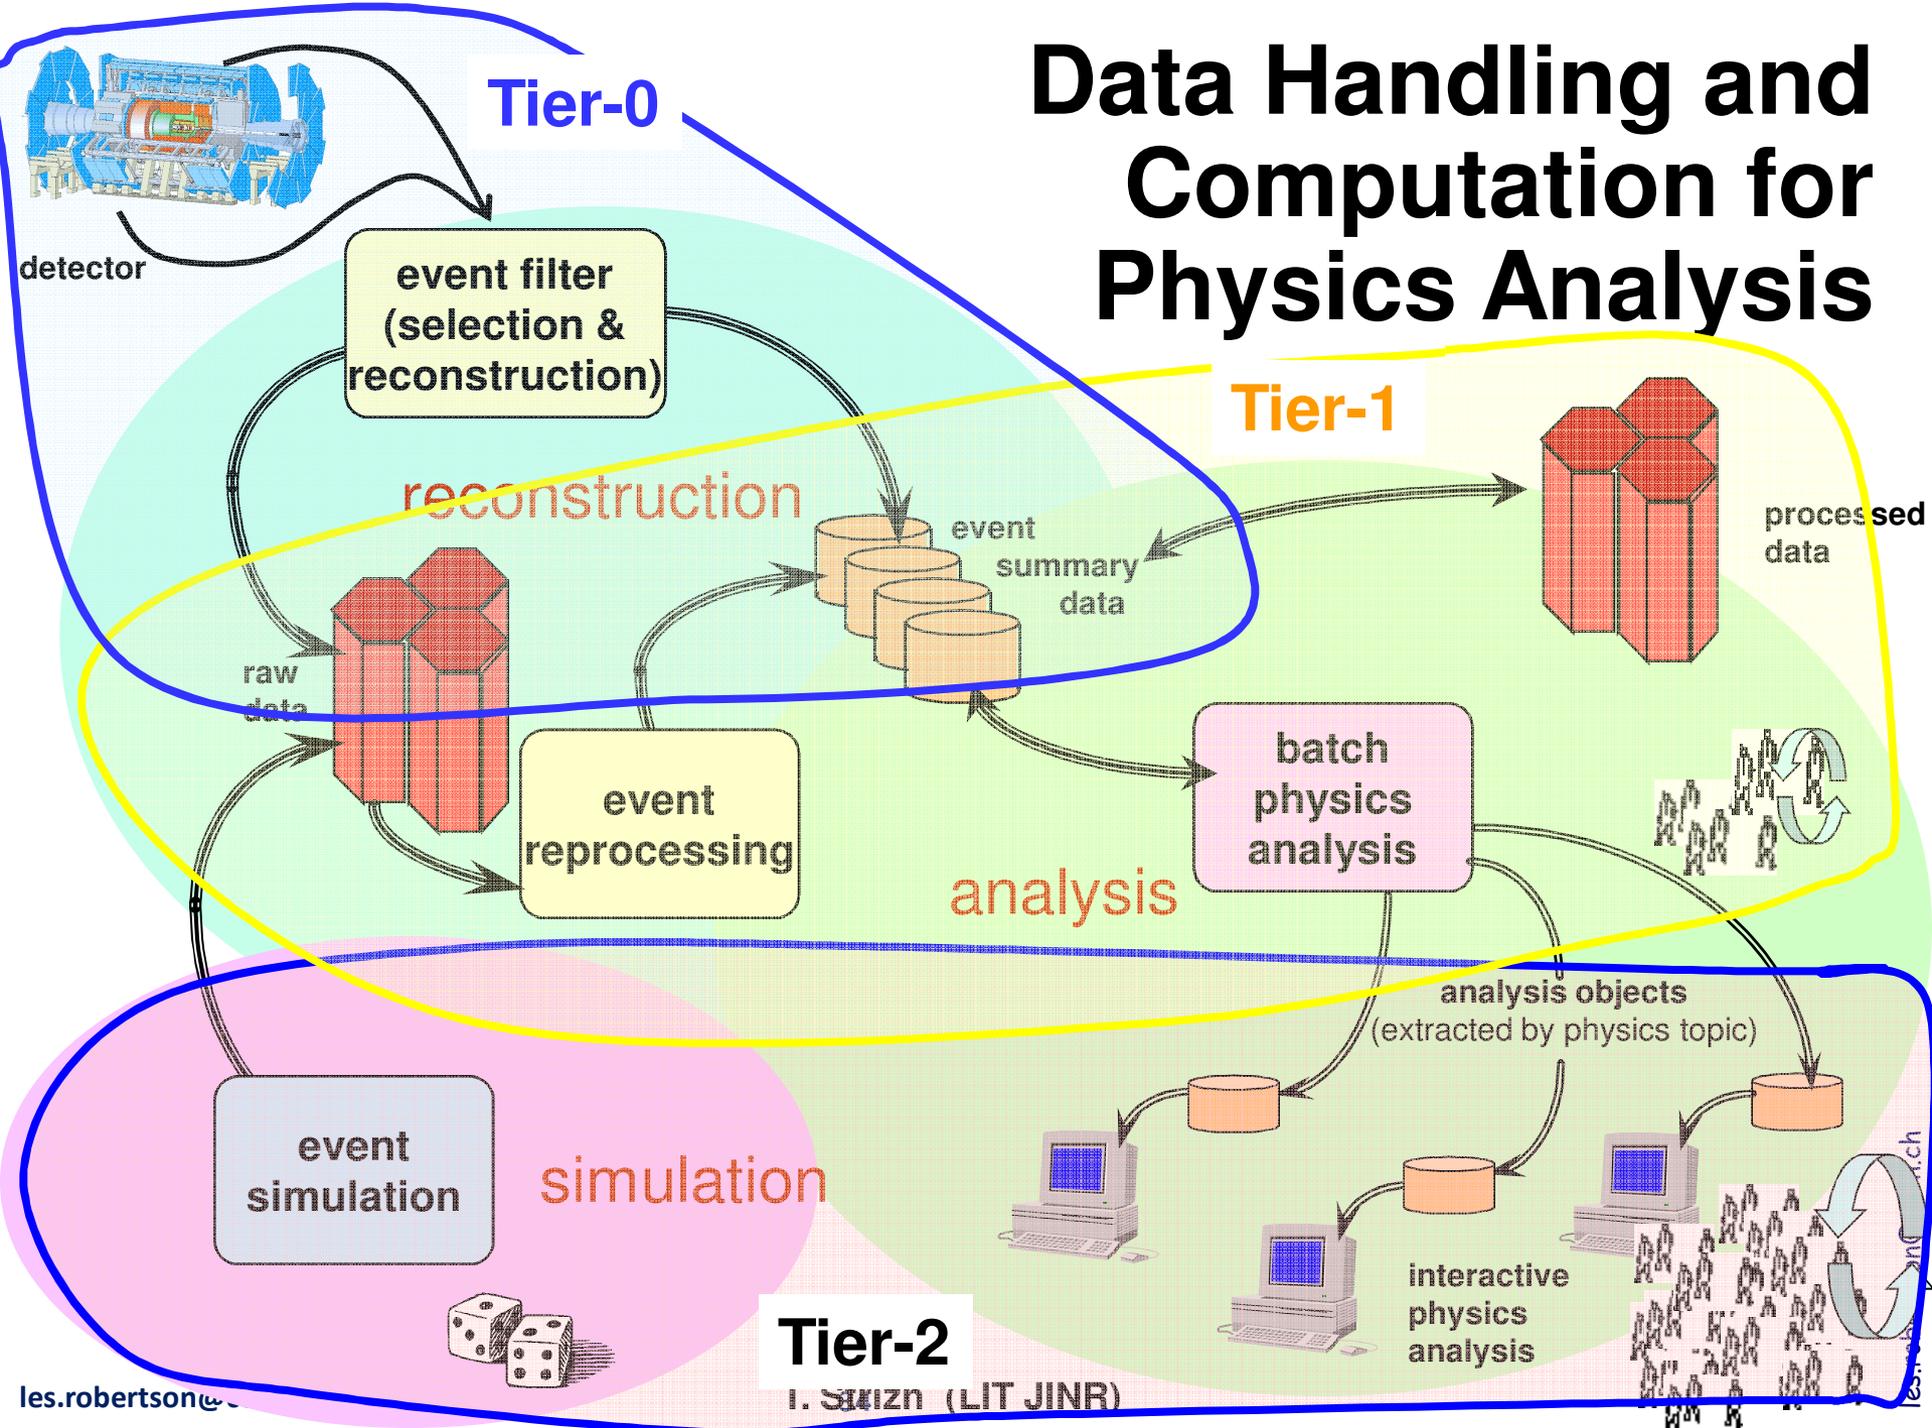

## Tier-1 (11 centres):

- Постоянное хранение данных
- Реконструкция и обработка
- Анализ

## Tier-2 (>200 centres):

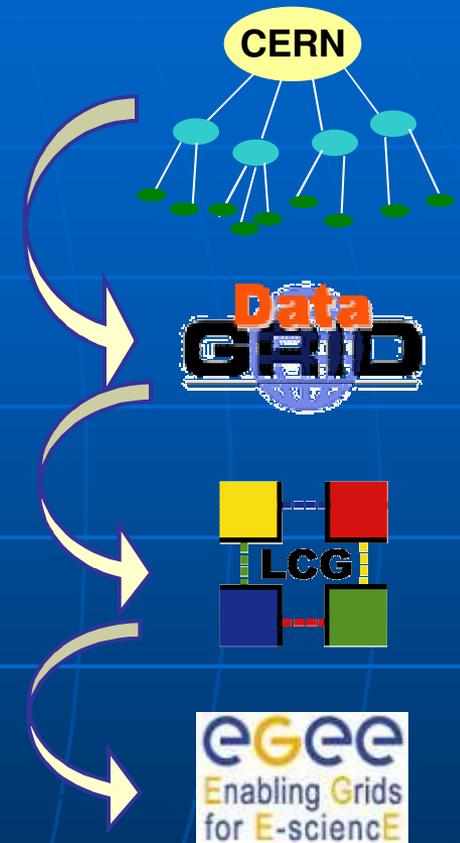

- Моделирование
- Физический анализ

# Data Handling and Computation for Physics Analysis

# Some history

- **1999 – Monarc Project**
  - Early discussions on how to organise distributed computing for LHC
- **2001-2003 - EU DataGrid project**
  - middleware & testbed for an operational grid
- **2002-2005 – LHC Computing Grid – LCG**
  - deploying the results of DataGrid to provide a production facility for LHC experiments
- **2004-2006 – EU EGEE project phase 1**
  - starts from the LCG grid
  - shared production infrastructure
  - expanding to other communities and sciences
- **2006-2008 – EU EGEE-II**
  - Building on phase 1
  - Expanding applications and communities ...
- **2008-2010 – EU EGEE-III**

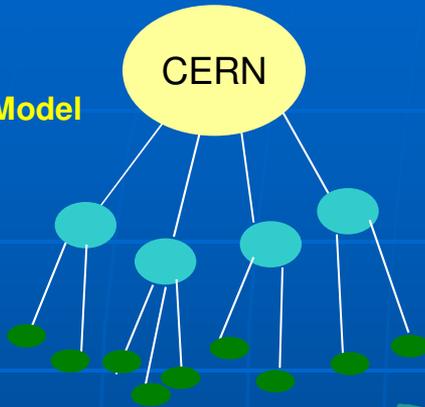

# MONARC project

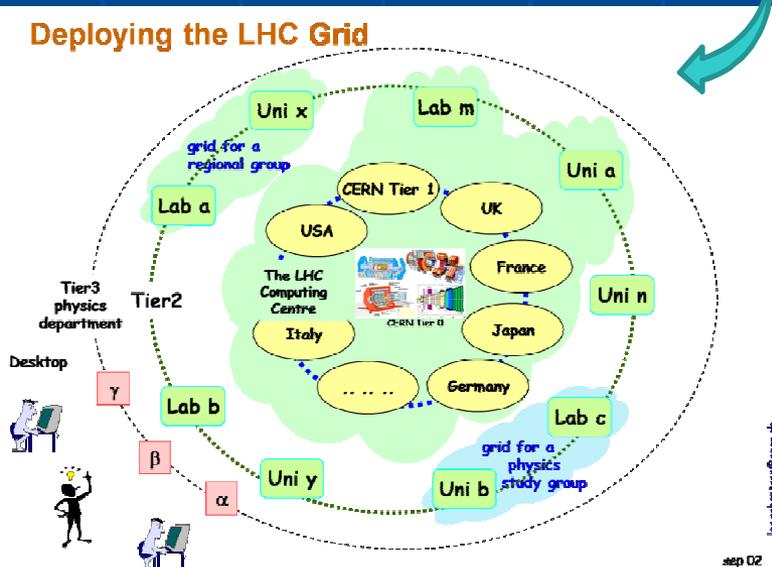

- 1998 – MONARC project
  - a distributed model
    - Integrate existing centres, department clusters, recognising that funding is easier if the equipment is installed at home
    - Devolution of control– local physics groups have more influence over how local resources are used, how the service evolves
  - a multi-Tier model
    - Enormous data volumes → looked after by a few (expensive) computing centres
    - Network costs favour regional data access
    - Simple model that HEP can develop and get into production ready for data in **2005**

# Then came the Grid

The MONARC Model

Deploying the LHC Grid

- 1999 – Grid
  - More flexible → easier to use, adapt to the reality of data analysis
  - But – more complex to build and to manage
  - However – the basics were already there!
  - Prospect of a general science grid (memories of research networks)
  - With expectation of non-HEP funding
    - during development
    - and for long term operation
- Consensus on this approach emerged during CHEP 2000 in Padova

# 2000s - the Decade of the Grid

- E-Science in fashion
- Many grid/science/physics projects funded in Europe and US
  - Stimulated international collaboration – open to all LHC sites
  - WLCG could operate on top of these multi-science infrastructure grids – EGEE, OSG, ..
  - de-facto standards
  - Significant non-HEP funding was made available to LHC groups and centres – supporting operation, tools and middleware, application development and adaptation to grids
- But many other sciences and also some industries have ported applications to the HEP style of Grid

# EGEE & OSG

**WLCG** depends on two major science grid infrastructures

**EGEE** - Enabling Grids for E-Science

**OSG** - US Open Science Grid

# WLCG activities

## Applications Area

*Common projects  
Libraries and tools,  
data management*

## Distributed Analysis

*Joint project on distributed  
analysis with the LHC  
experiments*

## Middleware Area

*Provision of grid  
middleware – acquisition,  
development, integration,  
testing, support*

## Grid Deployment Area

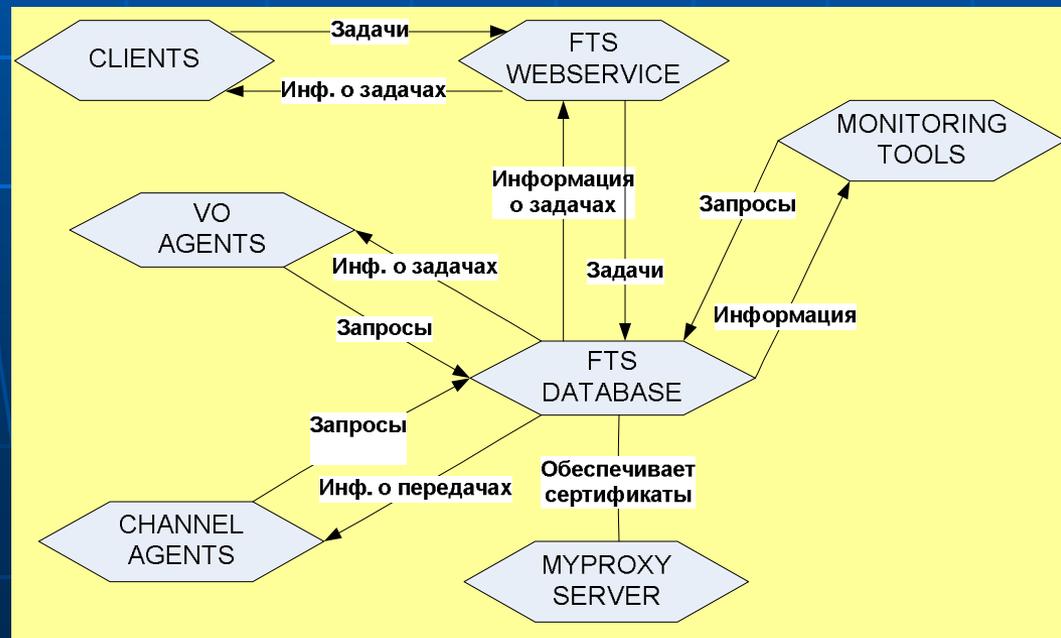

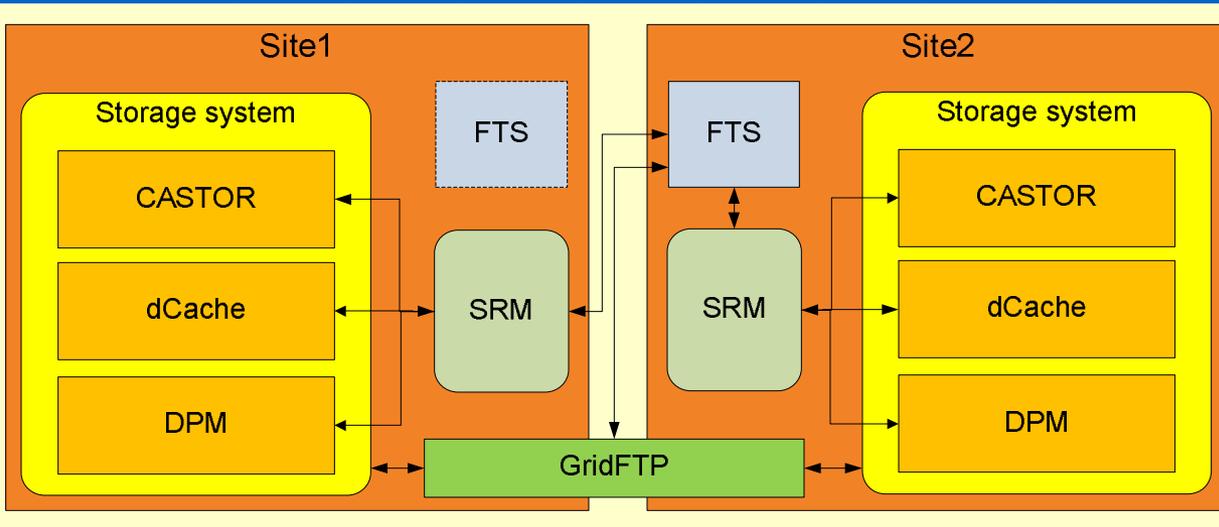

*Establishing and managing the  
Grid Service - Middleware  
certification, security, operations.  
Service Challenges*

## CERN Fabric Area

*Cluster management  
Data handling  
Cluster technology  
Networking (WAN+local)  
Computing service at CERN*

# File Transfer System Monitoring and Testing

# Integration with Google Earth

Google Earth interface showing a map of Europe with various LHC detector locations marked. The map includes labels for T2\_DE\_DESY, T2\_PL\_WARSAW, T3\_UK\_SGRID\_OXFORD, T3\_UK\_LONDON\_UCL, T2\_BE\_IHE, T2\_DE\_RWTH, T2\_FR\_GRIF\_LL, T3\_DE\_KARLSRUHE, T2\_FR\_IPHC, T2\_AT\_VIENNA, T2\_ES\_IFCA, T3\_ES\_OVIEDO, T2\_ES\_CIEMA, T2\_PT\_LIP\_LISBON, and T2\_TR\_METU. A pink text box is overlaid on the map, containing the following text:

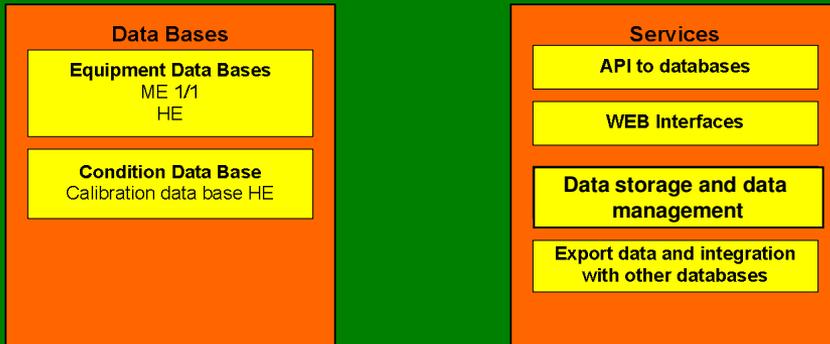

Running jobs: 31451  
transfer rate: 1.35 GiB/sec

Experiment specific monitoring systems provide input data  
Dashboard agents publish this information in the KML format  
Strong contribution to the development of Sergey Mitsyn (JINR)  
Application will be shown during the LHC demo at the EGEE conference in Barcelona

The interface also shows a search bar, a 'Places' list with 'CMSNew' selected, and a 'Layers' list with 'Primary Database' and 'Geographic Web' selected. The bottom status bar shows the date 'Sep 9, 2009 11:32:38 pm' and coordinates '44°52'59.96" N 34°59'50.07" E'.

# RDMS CMS Data Bases

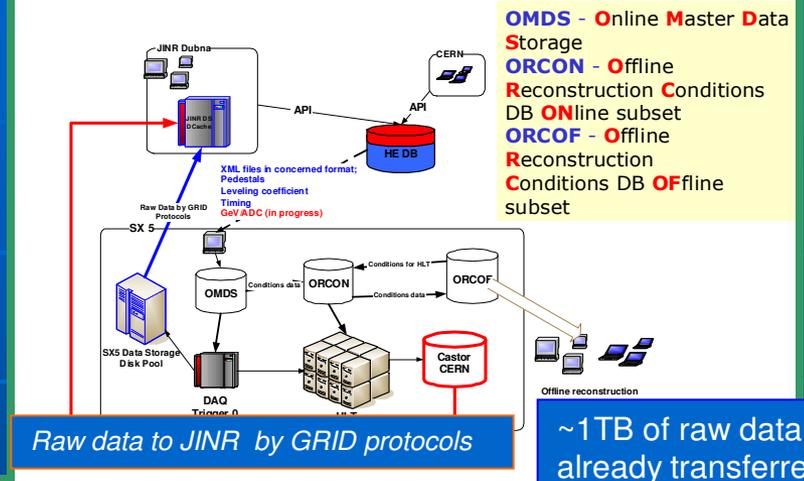

## RDMS CMS Data Management system

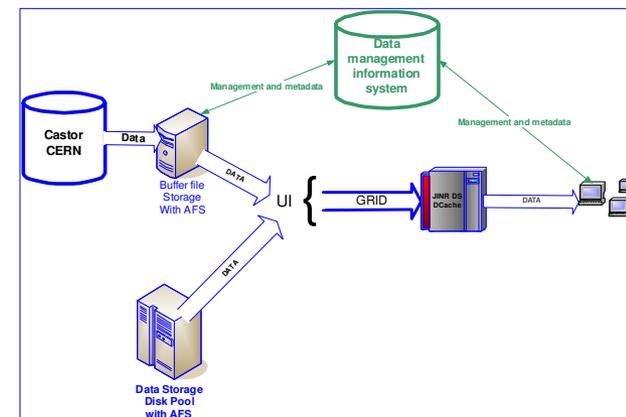

## HE Calibration DB Status

- System is online
- Full calibration cycle support
- Integrated into CMS computing environment
- ~30000 records
- ~500Mb
- ~600Gb raw data transferred to JINR

## HE Calibration and Raw Data Flow

## CERN - JINR Data management for MTCC: common schema of realization

# Удалённый мониторинг

- Коллаборация АТЛАС:
  - 164 институтов из 35 стран
- Для эффективного участия в коллаборации пользователи должны иметь возможность:
  - Отслеживать общий статус эксперимента
  - Отслеживать состояние подсистем, разработанных в их институтах
- Эти задачи решаются с помощью системы удалённого мониторинга

# Remote ATLAS Control Room in Dubna

## MOTIVATION

- Monitoring of the detector at any time
- Participation of the subsystem experts from Dubna in the shifts and data quality checks remotely
- Training the shifters before they come to CERN

ACR at CERN

**The goal - to have reduced copy at JINR**
