General Safety Aspects and PS Access System Issues

Monday 22 January 2007 14:20 (25 minutes)

The presentation will highlight the most important changes from 2006 to 2007 on safety aspects for accelerator operation. Any important modifications of procedures or systems will be outlined (e.g. habil. électrique).

The implementation of the PS inflector zone will be analysed and the requirements on access system and zone layout will be discussed. Last year during extensive electrical tests after the PS magnet exchange and LEIR installation, a lack of procedures for access management and safety during electrical tests in PS and inflector zone became evident. Rules for future tests will be outlined.
