Update about Wi-Fi service enhancement at CERN

Monday, 8 October 2018 14:25 (25 minutes)

During recent times, we can observe a situation where Wi-Fi service starts to be primary Internet connection method in a campus networking. Wireless access is no longer an additional service or just interesting technology for conference and meeting rooms - now support for mobility is expected. In 2016, CERN launched global Wi-Fi renewal project across its campus. The subject of the project is to cover more than 200 office buildings with modern, highly reliable wireless solution. Project itself was presented during previous HEPiX workshop. This year, being in the final phase of deployment, the presentation will focus on implemented features, faced issues and an interaction with the manufacturers. Moreover, project extension for outdoor coverage of key areas across the CERN campus will be discussed.

Desired length

20 minutes
