## Higgs Triplet Model as extension BSM

- \* As motivation, the HTM relating directly the smallness of the neutrino masses. [R. N. Mohapatra and G. Senjanovic, Phys. Rev. Lett. 44, 912 (1980)].

- \* In addition to the SM Higgs field  $\Phi$ ,

$$\Phi = \begin{pmatrix} \Phi^+ \\ \Phi^0 \end{pmatrix} \sim (1, 2, 1),$$

- \* the HTM contains an additional  $SU(2)_L$  triplet Higgs field

$$\Delta = \begin{pmatrix} \frac{\Delta^+}{\sqrt{2}} & \Delta^{++} \\ \Delta^0 & -\frac{\Delta^+}{\sqrt{2}} \end{pmatrix} \sim (1, 3, 2).$$

- \* We denote the neutral components of the SM doublet and triplet Higgs fields as :

$$\Phi^0 = \frac{1}{\sqrt{2}}(\phi^0 + i\chi^0) \text{ and } \Delta^0 = \frac{1}{\sqrt{2}}(\delta^0 + i\eta^0)$$

Numerical results

$$\sigma(e^+ e^- \rightarrow \gamma h^0)$$

$$\sigma(e^- \gamma \rightarrow e^- h^0)$$

$$R\text{-}\gamma \gamma (h^0) \text{ vs } R\text{-}\gamma z (h^0)$$

Conclusion/Perspective

The scalar potential of the Higgs fields  $\Phi$  and  $\Delta$  is [A. Arhrib et al, Phys. Rev. D 84, 095005 (2011), P. Fileviez Perez et al, Phys. Rev. D 78, 015018 (2008)].

$$\begin{aligned} V(\Phi, \Delta) &= m_\Phi^2 \Phi^\dagger \Phi + M_\Delta^2 \text{Tr}(\Delta^\dagger \Delta) + (\mu \Phi^T i \tau_2 \Delta^\dagger \Phi + \text{h.c.}) \\ &+ \frac{\lambda}{4} (\Phi^\dagger \Phi)^2 + \lambda_1 (\Phi^\dagger \Phi) \text{Tr}(\Delta^\dagger \Delta) + \lambda_2 [\text{Tr}(\Delta^\dagger \Delta)]^2 \\ &+ \lambda_3 \text{Tr}[(\Delta^\dagger \Delta)^2] + \lambda_4 \Phi^\dagger \Delta \Delta^\dagger \Phi, \end{aligned}$$

After EWSB,  $\phi^0$  and  $\delta^0$  acquire vevs denoted as  $v_d$  and  $v_t$  with  $v^2 = v_d^2 + 2 v_t^2 = (246 \text{ GeV})^2$ .

Then 7 physical Higgs states :

$$\begin{aligned} &H^{\pm\pm}, H^\pm, \\ &A^0, \\ &H^0, \\ &\& h^0 = \text{SM-like}. \end{aligned}$$

## Theoretical requirements

Conclusion/Perspective

## Experimental requirements

For the neutral Higgs bosons:

- \* From LEP direct search results :  $m_H, m_A \geq 80 - 90$  GeV.

As for the singly charged Higgs boson:

- \* From LEP direct search results :  $m_{H^\pm} \geq 78$  GeV.
- \* LHC limits may not be applicable.

In the case of the doubly charged Higgs boson:

- \* From LEP direct search results :  $m_{H^{\pm\pm}} \geq 97.3$  GeV.
- \* From LHC
  - o For  $v_t \lesssim 10^{-4}$  GeV,  $m_{H^{\pm\pm}} > 820$  GeV.
  - o For  $v_t \gtrsim 10^{-4}$  GeV,  $m_{H^{\pm\pm}} > 90 - 100$  GeV.

$$e^+ e^- \rightarrow \gamma h^0$$

$$e^- \gamma \rightarrow e^- h^0$$

$$R_{\gamma \nu} \text{ vs } R_{\gamma h^0} \text{ and } R_{e h^0}$$

Numerical results

$$\sigma(e^+ e^- \rightarrow \gamma h^0)$$

$$\sigma(e^- \gamma \rightarrow e^- h^0)$$

$$R_{\gamma \nu} \text{ vs } R_{\gamma h^0} \text{ and } R_{e h^0}$$

13 Conclusion/Perspective

# Conclusion

- \*ILC is expected to play a crucial role in understanding the nature of the Higgs boson due to the clean beams in the initial state.
- \*the one-loop processes  $e^+e^- \rightarrow \gamma h^0$  and  $e^- \gamma \rightarrow e^- h^0$  can be the key in the framework of HTM.

Associated production

$e^+e^- \rightarrow \gamma h^0$   
 $e^- \gamma \rightarrow e^- h^0$   
 $R_{\gamma \nu}$  vs  $R_{\gamma h^0}$  and  $R_{e h^0}$

Numerical results

$\sigma(e^+e^- \rightarrow \gamma h^0)$   
 $\sigma(e^- \gamma \rightarrow e^- h^0)$   
 $R_{\gamma \gamma}(h^0)$  vs  $R_{\gamma z}(h^0)$

13 Conclusion/Perspective

# Conclusion

- \*ILC is expected to play a crucial role in understanding the nature of the Higgs boson due to the clean beams in the initial state.
- \*the one-loop processes  $e^+e^- \rightarrow \gamma h^0$  and  $e^- \gamma \rightarrow e^- h^0$  can be the key in the framework of HTM.
- \*singly (-doubly) charged Higgs loops in HTM can modify significantly the cross section compared to the SM predictions.
