

Higgs $\rightarrow \tau^+ \tau^-$ at ILC: coupling strength and CP properties

Daniel Jeans, KEK
for the
International Large Detector
concept group
Higgs Couplings 2018, Tokyo

International Linear Collider

$e^+ e^-$ collisions @ 250 GeV

beam polarisation:

e^- 80%, e^+ 30%

luminosity $\sim 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$

0.5 M Higgs in ~ 11 years

linear accelerator

→ future energy upgrades possible,
if and when needed

Integrated Luminosities [fb^{-1}]

presently under in-depth
consideration by the
Japanese Government

Higgs physics at ILC 250

comprehensive and precise study of Higgs sector [see F. Simon's plenary talk]

At 250 GeV, Higgs boson usually produced with a Z:
 "Higgs-strahlung"

Z boson and its momentum used to tag Higgs events:
 "recoil mass" method

Higgs decays to tau leptons

as most massive lepton,
tau enjoys strongest coupling to Higgs

tau lepton has somewhat short lifetime : 2.9×10^{-13} s

decays within detector
characteristic “narrow jet”

decay products displaced from interaction point

distribution of decay products
→ tau spin orientation

International Large Detector

one of two detector concepts being developed for ILC

high precision detector optimised for **particle flow** reconstruction

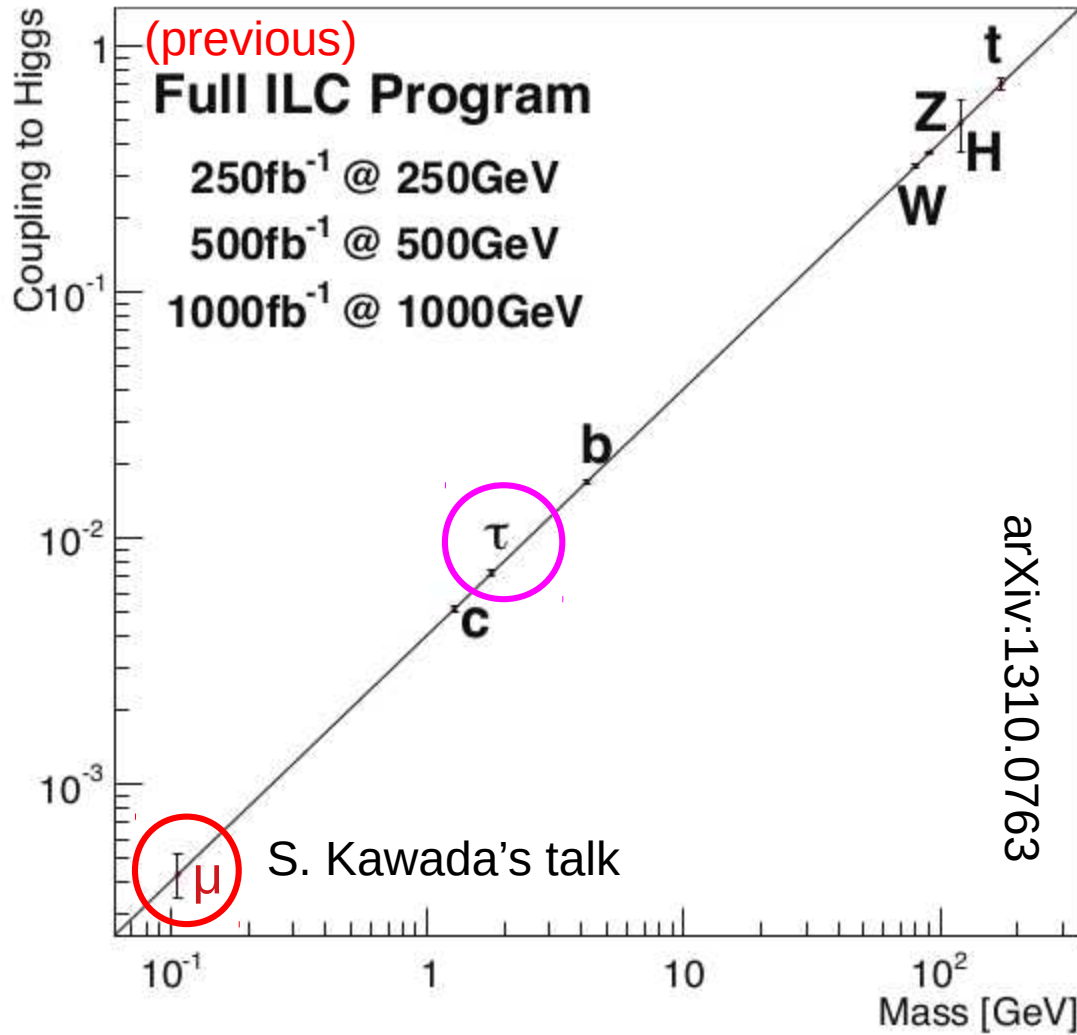

silicon, gaseous tracking systems

$$\sigma_{d0} \rightarrow 5 \mu\text{m}$$
$$\sigma_{pT}/p_T \rightarrow 2 \times 10^{-5} p_T$$

high granularity calorimetry
jet energy resolution 3-4%

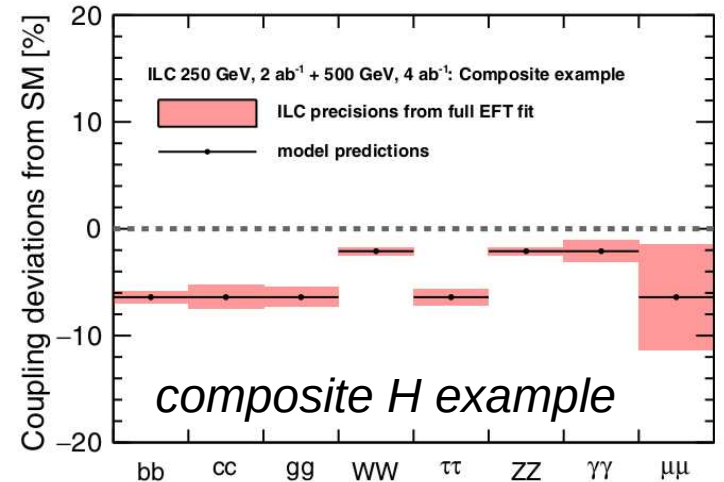

test the lepton Yukawa – mass relation

different BSM scenarios
 → patterns of deviations from SM

Phys. Rev. D 97, 053003

Higgs boson coupling to $\tau\tau$

*Studied using events fully simulation in ILD,
all SM background processes,
realistic reconstruction algorithms*

final states

$$e^+ e^- \rightarrow H Z \rightarrow \tau\tau + (ee, \mu\mu, qq)$$

event reconstruction and selection

isolated narrow jets,

1 or 3 charged particles

total jet charge ± 1

invariant mass $< 2 \text{ GeV}/c^2$

various cuts to reduce major backgrounds

colinear approximation to estimate
momenta of ν from τ decay

Eur. Phys. J. C75 (2015) no.12, 617

τ -pair invariant mass
colinear approximation

final event selection and
background rejection using
multivariate analysis [BDT]

Event counting after selection gives
expected ILC precision on

$$\sigma(h) \cdot \text{BR}(h \rightarrow \tau\tau) :$$

1.2 %	[ILC250 / 2 ab ⁻¹]
1.0 %	[+ ILC500 / 4 ab ⁻¹]

This measurement then combined with

- measured total cross-section $\sigma(h)$ to give $\text{BR}(h \rightarrow \tau\tau)$,
- measured total decay width Γ_H to extract Yukawa coupling $g(h\tau\tau)$

$\delta g(h\tau\tau) \sim 1.16\%$ using full E.F.T. fit, 2 ab⁻¹ at ILC250 + HL-LHC, LEP, ...

Phys.Rev. D97 (2018) no.5, 053003

does Higgs $\rightarrow \tau \tau$ conserve CP ?

baryogenesis at E-W scale?

Phys.Rev. D98 (2018)
no.1, 013007

$$h_{125} = \cos \psi_{CP} h^{CP\text{even}} + \sin \psi_{CP} A^{CP\text{odd}}$$

$$g \bar{f} (\cos \psi_{CP} + i \gamma^5 \sin \psi_{CP}) f h_{125}$$

“**polarimeter**” - estimator of spin direction from τ decay products

h is a spin 0 state:

$$|f \bar{f}\rangle = |\uparrow \downarrow\rangle + e^{2i \psi_{CP}} |\downarrow \uparrow\rangle$$

[$\psi_{CP} = 0$ CP even,
 $\pi/2$ CP odd]

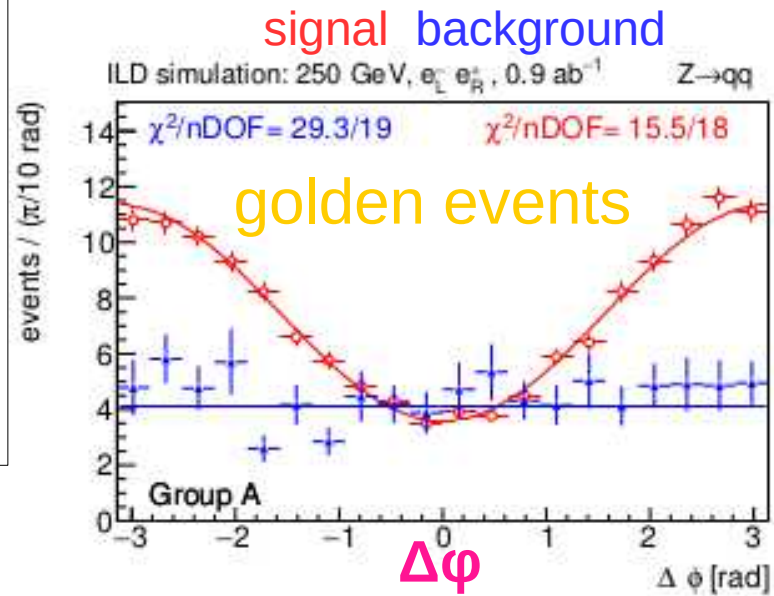

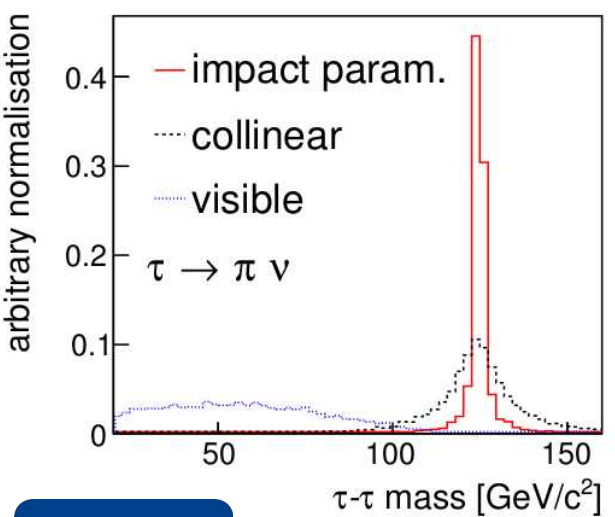

CP in $h \rightarrow \tau\tau$: sensitivity

In **Higgs-strahlung** process, **fully reconstruct** momentum of hadronically decaying tau leptons. Using constraints from

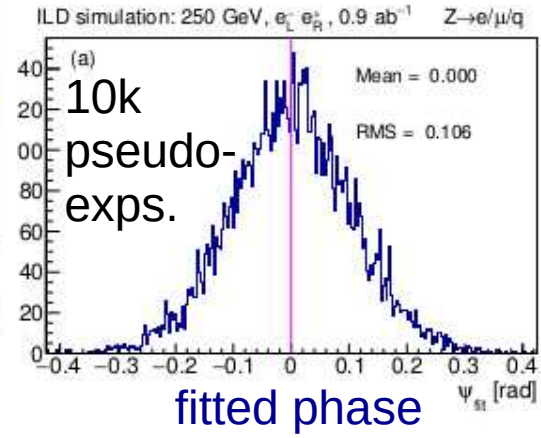

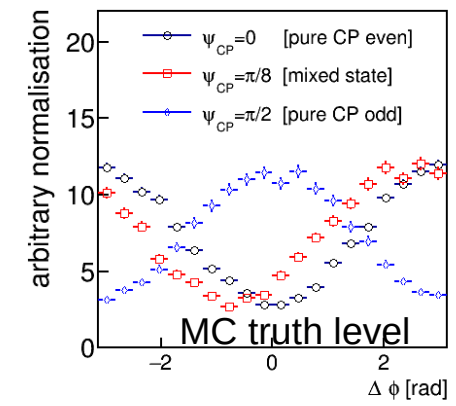

- interaction point
- recoiling transverse momentum
- impact parameters
- tau lepton mass

NIM A810 (2016) 51, arXiv:1507.01700

- $\tau^\pm \rightarrow \pi^\pm \nu$ [B.R. 11%]
- $\tau^\pm \rightarrow \pi^\pm \pi^0 \nu$ [B.R. 26%]

signal: phase of $\Delta\phi \rightarrow$ CP
backgrounds: flat

fitted phase
pseudo-experiments:
likelihood fit to
 $\Delta\phi$ distributions

with 2 ab^{-1} @ ILC250, can measure mixing between even and odd CP components:
 $\delta \psi_{CP} = \mathbf{75 \text{ mrad (4.3 deg)}}$

Summary

International Linear Collider will enable comprehensive set of precision Higgs measurements, shining light on **physics beyond the SM**

ILC-250 stage:

$\sigma(h) \cdot BR(h \rightarrow \tau\tau)$ with a precision of 1.2 % [1.0 % w/ ILC500]

- several times more precise than current HL-LHC projections
- signatures of BSM physics ?

CP mixing in $h \rightarrow \tau\tau$ decays with a precision of 75 mrad

- Electro-Weak baryogenesis ?

backup

full τ momentum reconstruction

NIM A810 (2016) 51

arXiv:1507.01700

in Higgs-strahlung $e^+ e^- \rightarrow ZH, H \rightarrow \tau \tau$

visible Z decay:

- τ production vertex
- p_{τ} of di- τ system

excellent vertex detector:

- trajectory of τ decay products
- plane of τ momentum

6 constraints to solve for

6 unknowns / event with hadronic τ decays
2 × neutrino 3-momenta

polarimeter → spin estimator from
decay products' momenta

ILD full simulation

optimal information on τ momentum and spin
relies on excellent detector performance:
impact parameter, tracking, photon and jet measurement

reconstruct $Z \rightarrow (e e / \mu \mu / \text{jets}) + 2 \times (1\text{-prong tau jets})$

simple preselection

some distributions after reconstruction and pre-selection:

group events according to sensitivity to CP

quality of event reconstruction

background contamination

longitudinal polarimeter components
