The Inert Doublet Model at current and future colliders

Wednesday 28 November 2018 18:10 (25 minutes)

The Inert Doublet Model is an intriguing extension of the SM scalar sector. It is a two Higgs doublet model with a discrete Z_2 symmetry, that renders the lightest particle from the second doublet stable and therefore provides a good dark matter candidate. I will discuss current constraints on the model as well as discovery prospects at current and future colliders, with a special emphasis on future e^+e^- machines with center-of-mass energies up to 3 TeV (CLIC), for a set of proposed benchmark points. For these, large parts of parameter space promise to be testable with high significances.

Content of the contribution

Both

Primary authors: ROBENS, Tania (MTA-DE Particle Physics Research Group, University of Debrecen, 4); KALINOWSKI, Jan (University of Warsaw); Dr KOTLARSKI, Wojciech (TU - Dresden); SOKOLOWSKA, Dorota (University of Warsaw); ZARNECKI, Aleksander Filip (University of Warsaw)

Presenter: ROBENS, Tania (MTA-DE Particle Physics Research Group, University of Debrecen, 4)

Session Classification: New results from LHC, new facilities

Track Classification: [8] New results from LHC, new facilities
