

## Commissioning and performance of the CMS calorimeter systems with proton-proton collisions at the LHC

Philippe Gras<sup>1</sup>  
On behalf of CMS collaboration

<sup>1</sup> CEA/IRFU - Saclay

- Overview
- Start-up conditions
- Detector performance
- Physics object performance
- Conclusions

# CMS Detector

**HCAL**  $|\eta| < 5$   
**ECAL**  $|\eta| < 3.0$   
**Tracker**  $|\eta| < 2.5$   
**Muons**  $|\eta| < 2.4$

**SILICON TRACKER**  
 Pixels ( $100 \times 150 \mu\text{m}^2$ )  
 $\sim 1\text{m}^2$  66M channels  
 Microstrips ( $50\text{-}100\mu\text{m}$ )  
 $\sim 210\text{m}^2$  9.6M channels

**CRYSTAL ELECTROMAGNETIC CALORIMETER (ECAL)**  
 76k scintillating  $\text{PbWO}_4$  crystals

**PRESHOWER**  
 Silicon strips  
 $\sim 16\text{m}^2$  137k channels

**FORWARD CALORIMETER**  
 Steel + quartz fibres

**MUON CHAMBERS**  
 Barrel: Drift Tubes & Resistive Plate Chambers  
 Endcaps: Cathode Strip Chambers & Resistive Plate Chambers

**HADRON CALORIMETER (HCAL)**  
 Brass + plastic scintillator

**SUPERCONDUCTING SOLENOID**  
 Niobium-titanium coil  
 carrying  $\sim 18000$  A

**STEEL RETURN YOKE**  
 $\sim 13000$  tonnes

Pixels  
 Tracker  
 ECAL  
 HCAL  
 Solenoid  
 Steel Yoke  
 Muons

**Total weight** : 14000 tonnes  
**Overall diameter** : 15.0 m  
**Overall length** : 28.7 m  
**Magnetic field** : 3.8 T

- Electromagnetic calorimeter, ECAL:  
Homogeneous  $\text{PbWO}_4$  crystal calorimeter
  - Barrel (EB):  $\text{PbWO}_4$ 
    - $26X_0$ .  $\Delta\eta \times \Delta\phi = 0.0174 \times 0.0174$
  - Endcap (EE):  $\text{PbWO}_4$ 
    - $25X_0$ .  $\Delta\eta \times \Delta\phi = 0.021 \times 0.021 \sim 0.050 \times 0.050$
  - Preshower in endcap (ES):  $3X_0$  lead with 2 planes of 61mm x 1.9mm Si strips
  - Target resolution: 0.5% at high energy
  - > 99% working channels (EB: 99.3, EE: 98.94, ES: 99.8)
  - stable conditions: temp. RMS 0.003°C (EE: 0.015°C). Laser response stability < 0.02%.

- Hadronic calorimeter, HCAL:

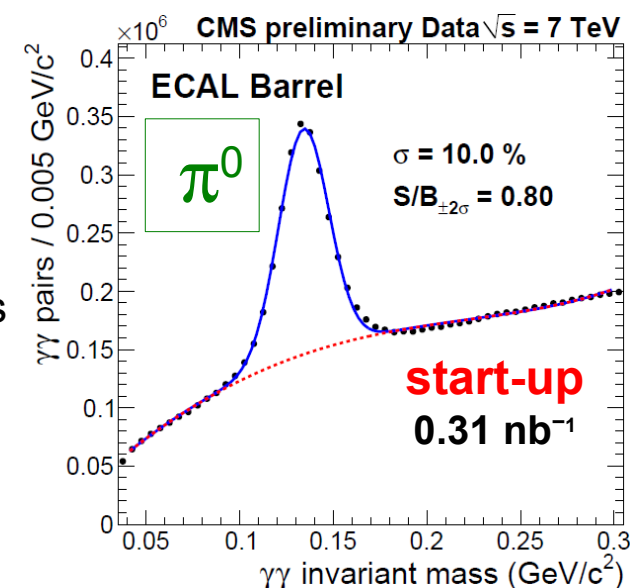

- Barrel (HB): Brass + Scintillators
  - $\Delta\eta \times \Delta\phi = 0.087 \times 0.087$
- Barrel tail catcher (HO): Scintillators
- Endcap (HE): Brass + Scintillators
  - $\Delta\eta \times \Delta\phi = 0.087 \times 0.087 \dots 0.35 \times 0.087$
- Forward (HF): Steel + quartz fibre (Čerenkov)
  - $\Delta\eta \times \Delta\phi = 0.349 \times (0.175 \text{ or } 0.35)$
- > 99.75% working channels (100% in HB/HE/HF)

# ECAL start-up conditions

- Synchronization
  - All channels synchronized.
  - Providing a time measurement precision better than 1ns.
- Calibration
  - Start-up calibration uses results from a 10-year campaign of test-beam and cosmic rays precalibration, in-situ “splash” events and  $\pi^0$  calibration.
  - Precision of start-up calibration:
    - EB: 0.5% ~ 2.2% (1.2% in central region with first 120 nb<sup>-1</sup>)
    - EE: 5%
    - ES: 2.2% (better than design goal)
  - Target with 10 pb<sup>-1</sup>: 0.5% in EB; 1%~2% in EE
- Alignment
  - ES vs EE:
    - misalignment < 0.5mm (+/- 0.2mm)
  - Tracker vs ES/EE:
    - $\Delta y = 7\sim 8\text{mm}$  for + and - side
    - $\Delta x \sim 5\text{mm}$  for + side
  - Possible small displacement in EB. Will be measured with the increased integrated luminosity

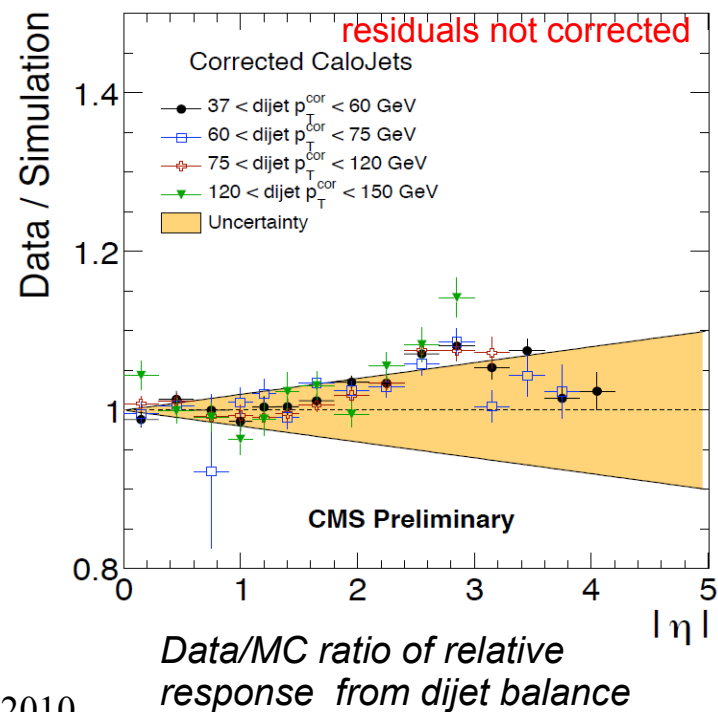

More details in posters #824 (Y. Yang), #507 (Z.-K. Liu), #477 (Y.-M. Tzeng)

# HCAL start-up conditions

- All channels synchronized
  - Providing a time measurement precision in HB and HE better than 2ns.
- Precalibration
  - Absolute scale set in test beam
  - Intercalibration made in-situ with  $\text{Co}^{60}$  source
  - Cosmic rays and “splash” events (*beam dumped on a collimator 150 m from IP*)
- Data-driven calibrations
  - Target: 5% on absolute scale, 0.5% (2%) on relative scale for barrel (endcap)
  - Requires  $\sim 10 \text{ pb}^{-1}$ . With available data, set limit on systematic uncertainties.
  - Single particle response:  $E_{\text{calo}}/p_{\text{track}}$ 
    - barrel: agreement with Monte Carlo within 3%
    - endcap: response  $\leq 8\%$  higher than Monte Carlo. It will be adjusted with more data when performing the actual calibration.
  - Jet energy scale: from dijet balance
    - Uncertainties currently used in analyses,  $10\% + 2\% |\eta|$  is confirmed within the statistics errors ( $71 \text{ nb}^{-1}$ , but with trigger prescale)

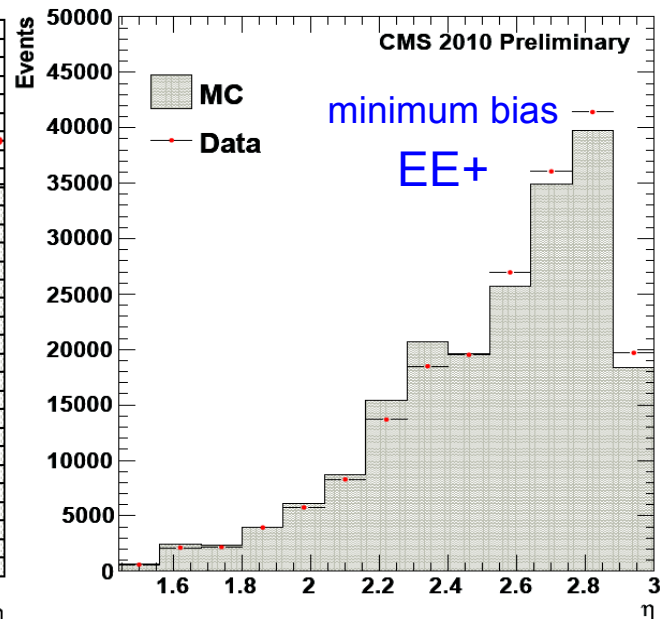

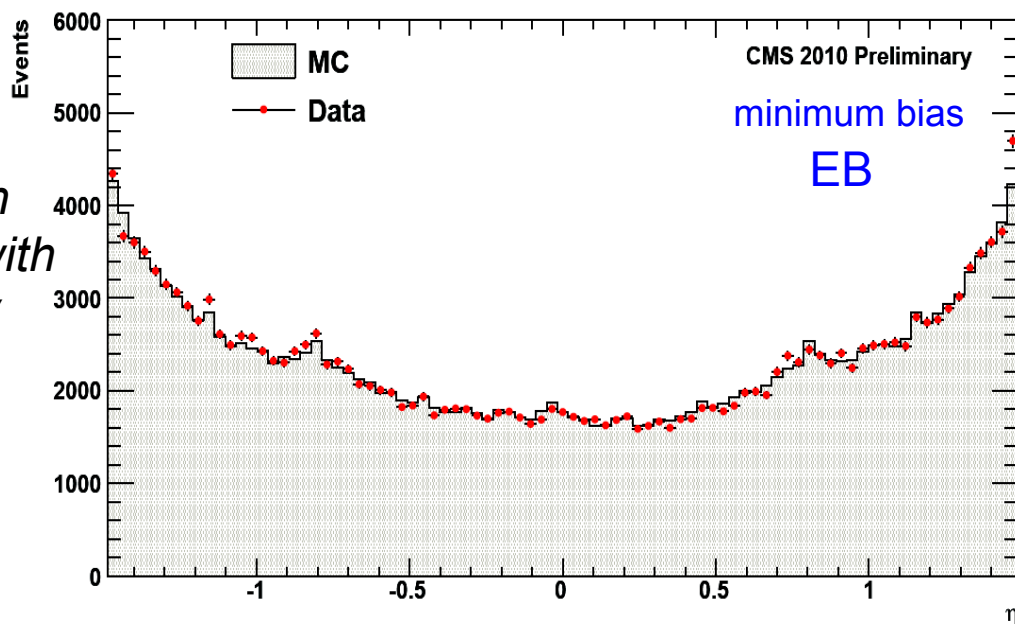

More details in P. De Barbaro's poster #854

# Detector response comprehension, ECAL

- Data and Monte Carlo in very good agreement without any Monte Carlo tuning

$\eta$  distribution of channel with max. energy

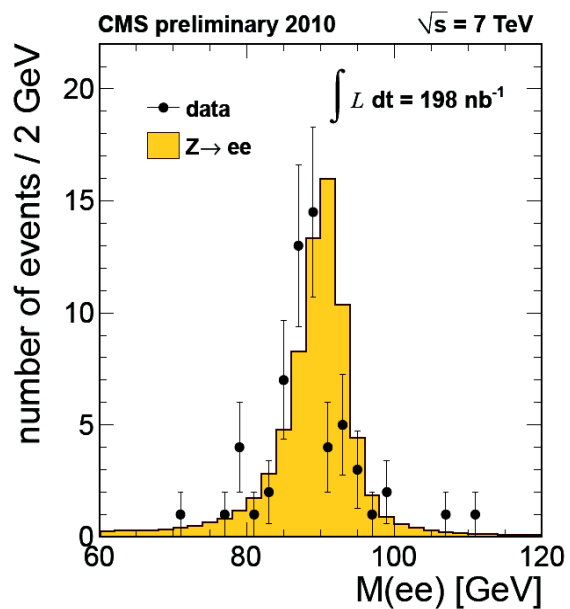

“out-of-the-box” Monte Carlo

Ratio of energy deposited in 3x3 crystal matrix to cluster energy.

See R. Salerno's talk on electron and photon reconstruction

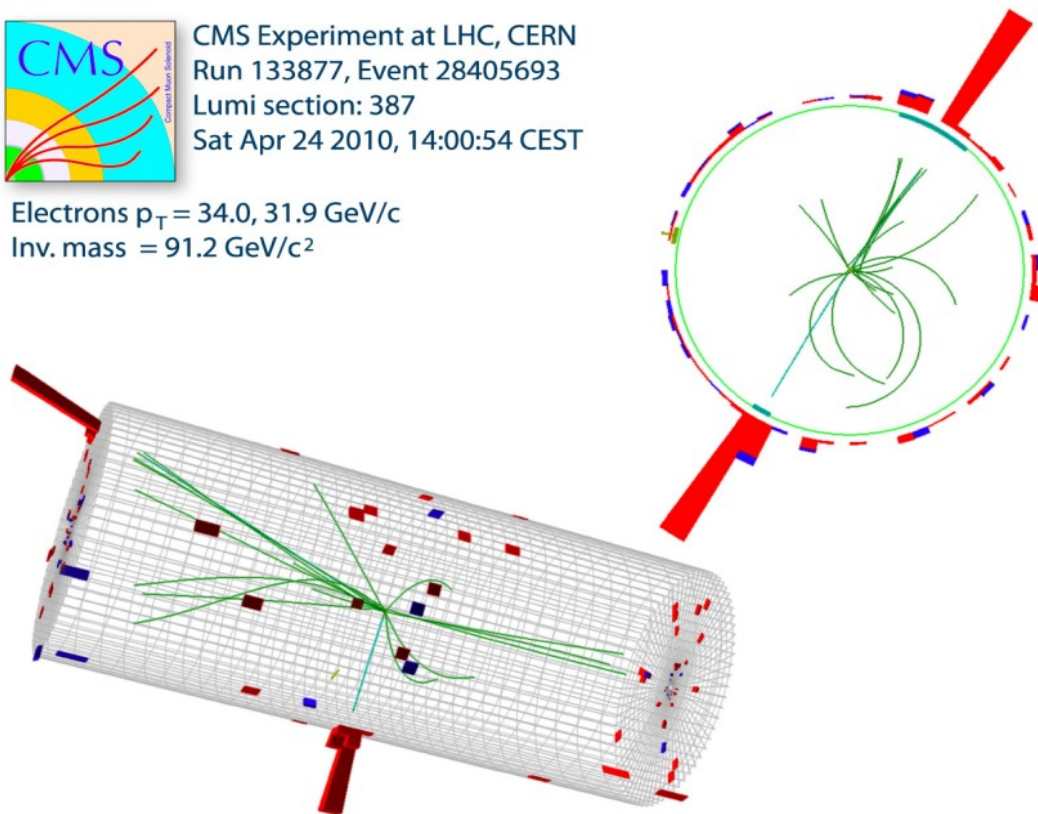

*Distribution of  $M_{ee}$  of selected  $Z \rightarrow e^+e^-$  candidates*

CMS Experiment at LHC, CERN  
Run 133877, Event 28405693  
Lumi section: 387  
Sat Apr 24 2010, 14:00:54 CEST

Electrons  $p_T = 34.0, 31.9$  GeV/c  
Inv. mass = 91.2 GeV/c<sup>2</sup>

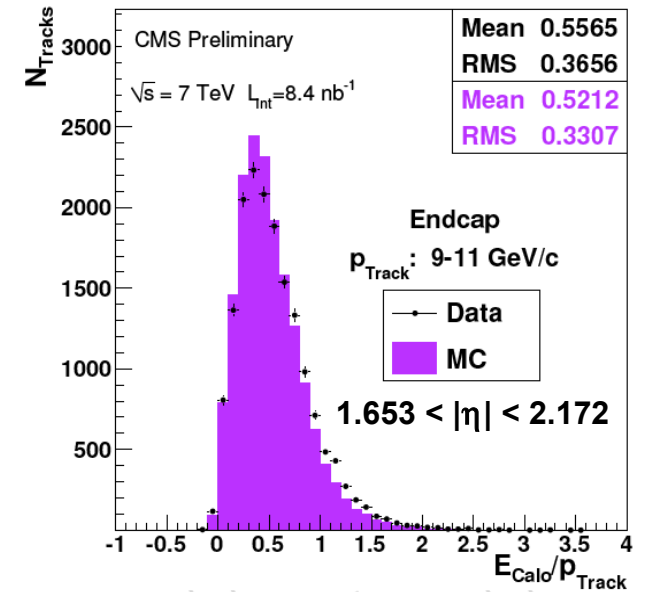

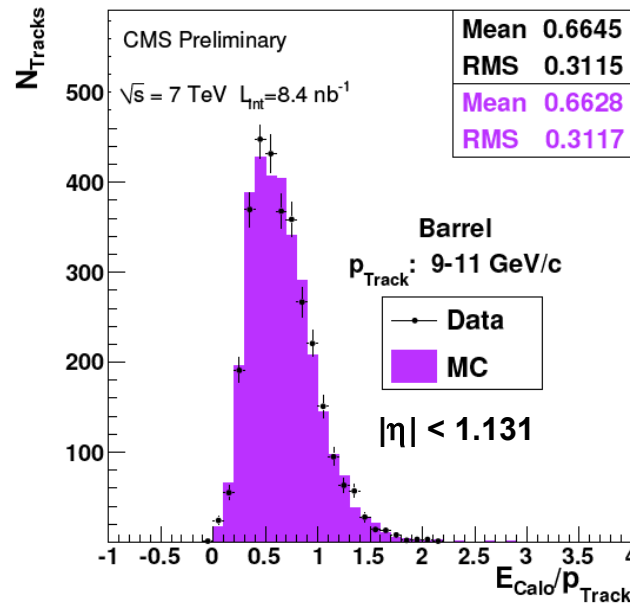

*See J. Mans' talk and M. Cepeda's talk*

# Detector response comprehension, HCAL

- Single particle response measurement as function of the track momentum. Selecting isolated charged particles with low deposit in ECAL ( $< 500\text{MeV}$ ).

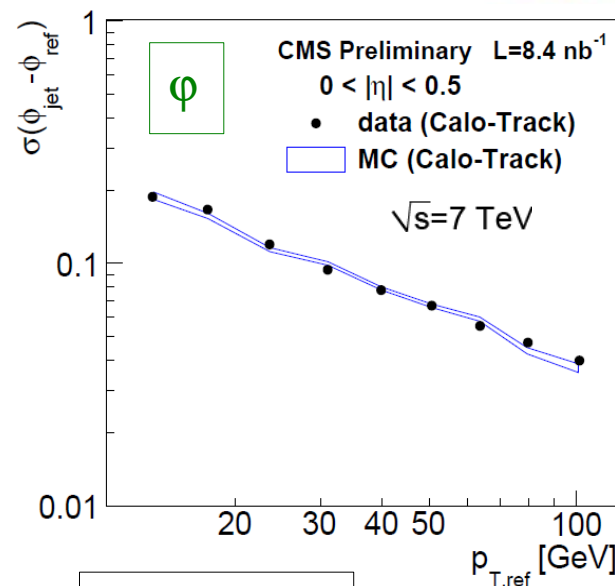

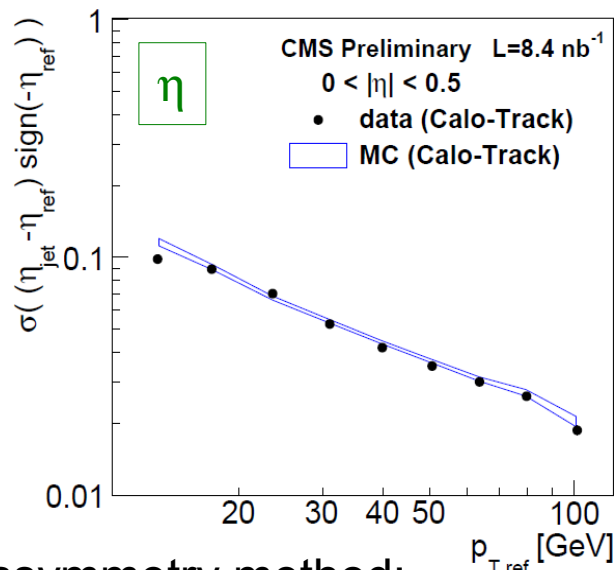

# Jet measurement resolution

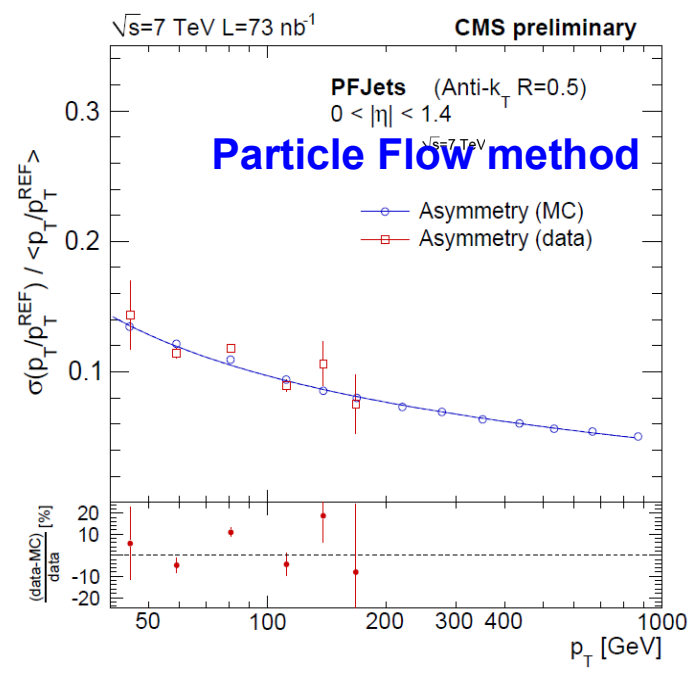

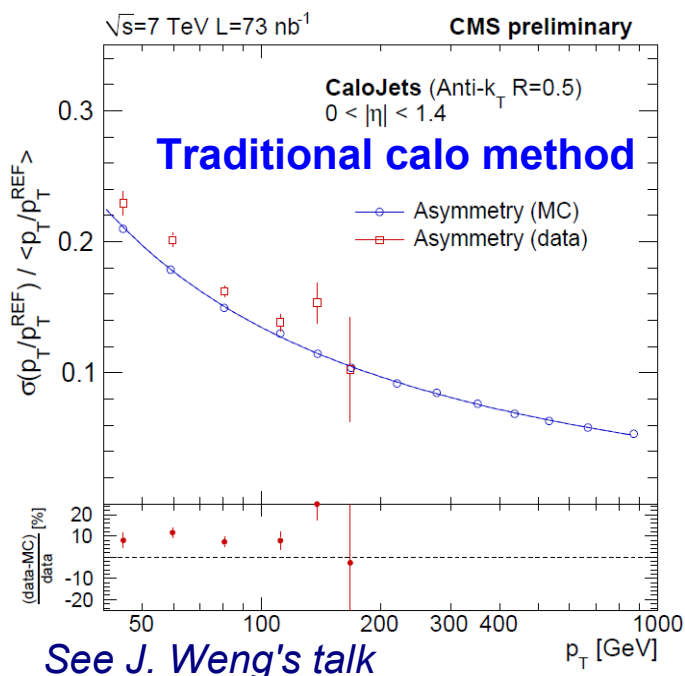

- Position resolution estimated by comparing tracker and calorimeter based measurements

*“out-of-the-box” Monte Carlo*

*anti-k<sub>t</sub> algo*

- $P_T$  resolution estimated with dijet asymmetry method:

**Particle flow technique** strongly improves resolution in low  $P_T$  range

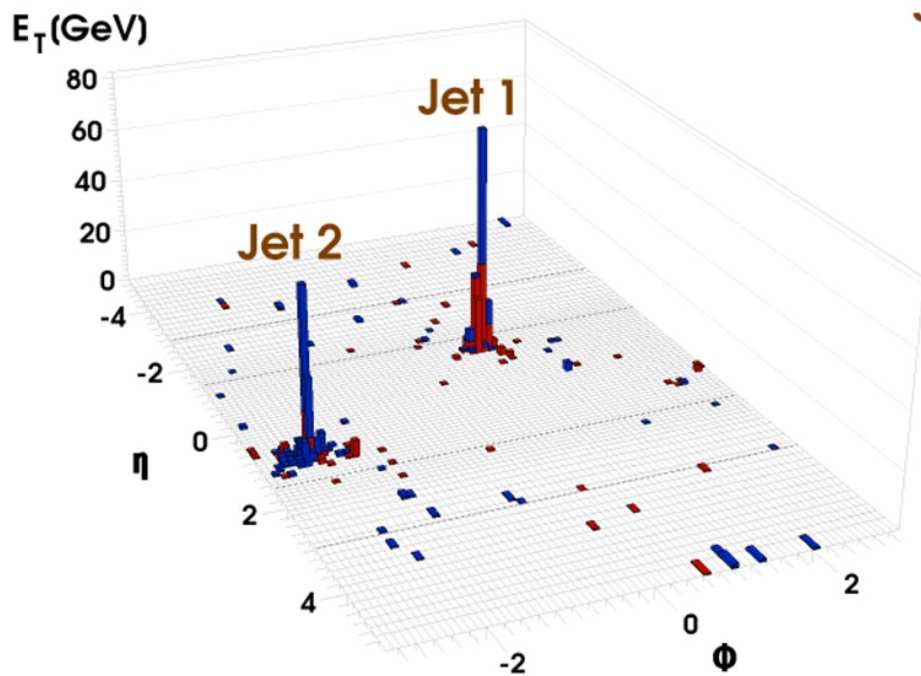

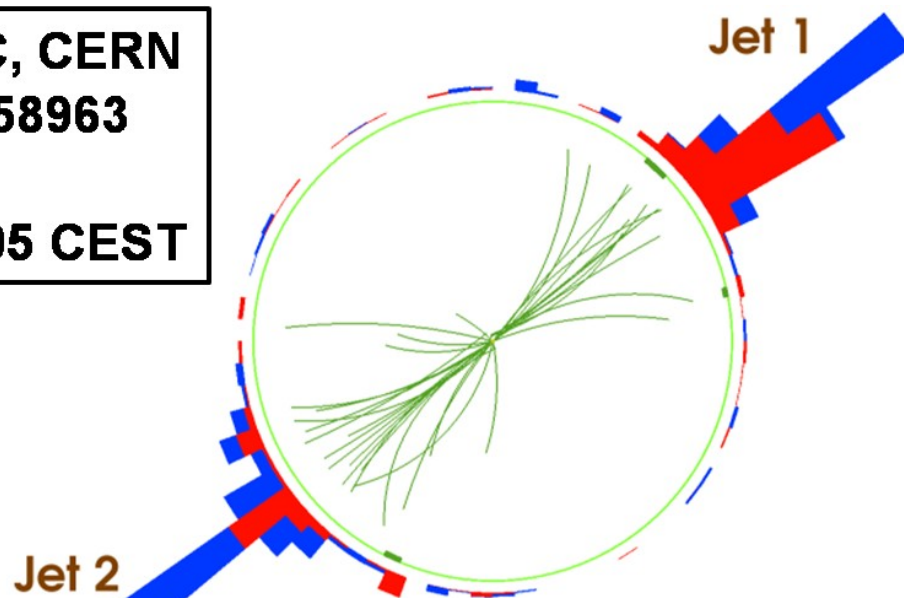

**Already better than design resolution (100%/sqrt(E) +/- 5%)**

See J. Weng's talk

# High mass dijet event

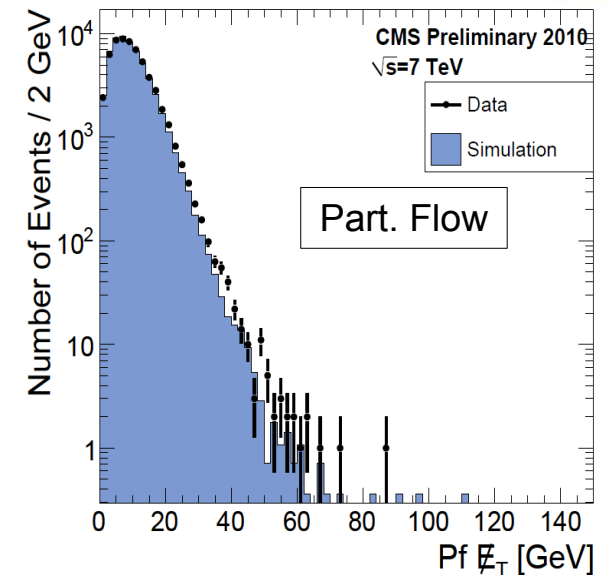

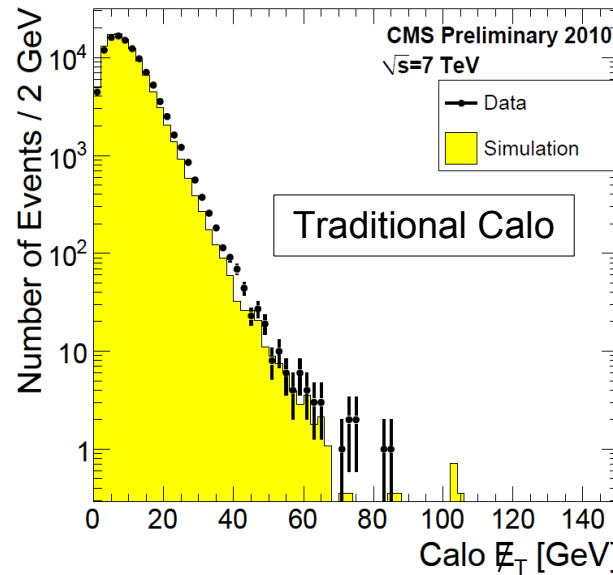

**CMS Experiment at LHC, CERN**  
**Run 133450 Event 16358963**  
**Lumi section: 285**  
**Sat Apr 17 2010, 12:25:05 CEST**

# Missing Et measurement performance

Missing  $E_T$  for Dijet events  
measured with two methods.  
 $p_T > 25 \text{ GeV}/c$

**Monte Carlo describes the data well over 3 orders of magnitude without tuning.**

Missing Et Gaussian core resolution:

- $< 10 \text{ GeV}$  on whole  $\Sigma E_T$  range up to  $350 \text{ GeV}$ .
- Factor 2 improvement from Particle Flow technique.

See particle flow algorithm F. Beaudette's talk this afternoon

- Excellent detector performance since the very beginning of data taking.
- Commissioning is essentially finished. It has fully exploited the (limited!) amount of available data.
- Calibration will advance very fast with the LHC luminosity ramp-up.
- First physics analyses with excellent results.

*Missing  $E_T$  distribution in  $W \rightarrow e\nu$  candidate events*

# Backup

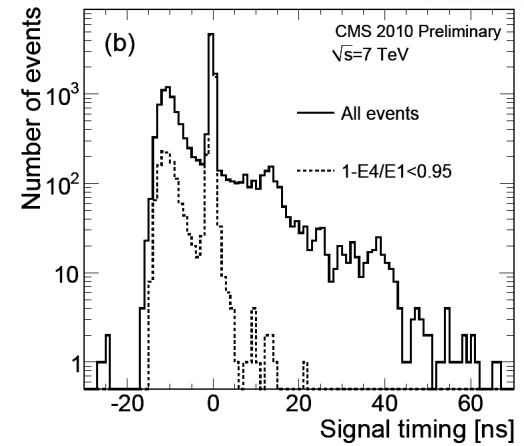

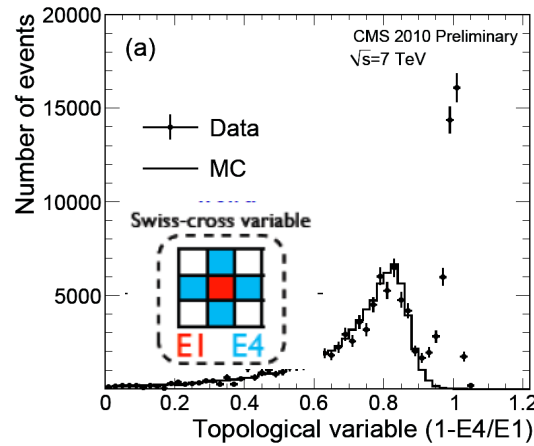

# Anomalous signal

CMS NOTE 2010-012

## ECAL barrel

- **origin:** heavily ionizing particles deposit energy in the Avalanche Photodiode
- **characteristic:** large signal on an isolated channel. Signal shape  $\sim 1$  in  $10^3$  minimum bias events.
- **filtering:** topological cut + timing

EB discriminating variables plot for the highest energy hit ( $E_T > 3\text{GeV}$ )

2010 JINST 5 T03014

## HCAL barrel - endcap

- **origin:** ion feedback, noise & discharges in HPDs
- **characteristic:** Random,  $\sim 10\text{-}20$  Hz ( $E > 20$  GeV).
- **filtering:** topology + timing

## HCAL forward

- **origin:** Čerenkov light by particles going through PMT glass
- Appear mostly in one channel in time with collisions
- **filtering:** based on energy sharing between long and short fibers + timing
