Measurement psi(3770) resonance parameters with KEDR detector at VEPP-4M

Thursday 22 July 2010 11:45 (15 minutes)

We present a measurement of the mass, total width and leptonic width of the $\psi(3770)$ meson. Results were obtained using data collected at the $\psi(3770)$ resonance with the KEDR detector at the electron-positron accelerator complex VEPP-4M.

The commonly used fitting procedure does not contain interference $\psi(3770)$ resonance and non-resonant DDbar cross section.

In our analysis we used a description of the $\psi(3770)$ resonance shape including interference.
