## The b-quark mass and the heavy-strange decay constant from lattice HQET

*Thursday 22 July 2010 16:30 (15 minutes)*

We present our strategy to compute the b-quark mass and the heavy-strange decay constant, in heavy quark effective theory including  $1/m$  corrections. By matching the effective theory and QCD in a small volume, one can determine non-perturbatively the bare parameters of the HQET Lagrangian and those of the heavy-light currents. The static, kinetic and magnetic energy of the heavy-light meson are obtained from large volume simulations. Using the GEVP method applied to all-to-all propagators allows us to isolate the ground state and the first excited state. I will show how the b-quark mass and the heavy-strange decay constant can be computed in this way, and I will present our preliminary results for the case of  $n_f=2$  flavors of dynamical quarks.
