Target and ion Source Development (TISD) mandate

Providing a large choice of **intense** and **pure radioactive beams**

Constant development is required to keep ISOLDE at the forefront of RIB facilities

- target and ion source units
- target materials
- beam interactions (p2n converter)
- ion source design / mode of operation shared with ISBM group

- yield & release study
- ion source efficiency measurements
- prototype tests

Sharing same resources as the ISOLDE physics program

- WORKSHOP: target unit production
- OFFLINE: target quality control
- ISOLDE: beamtime

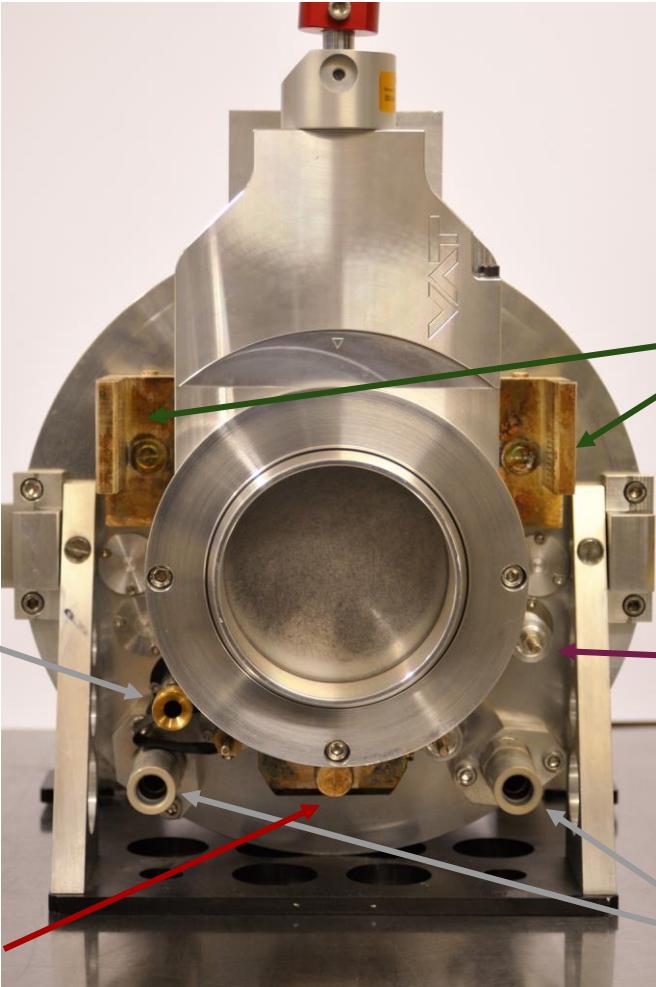

ISOLDE Target production

Slides and photos by
Andrés Viéitez Suárez

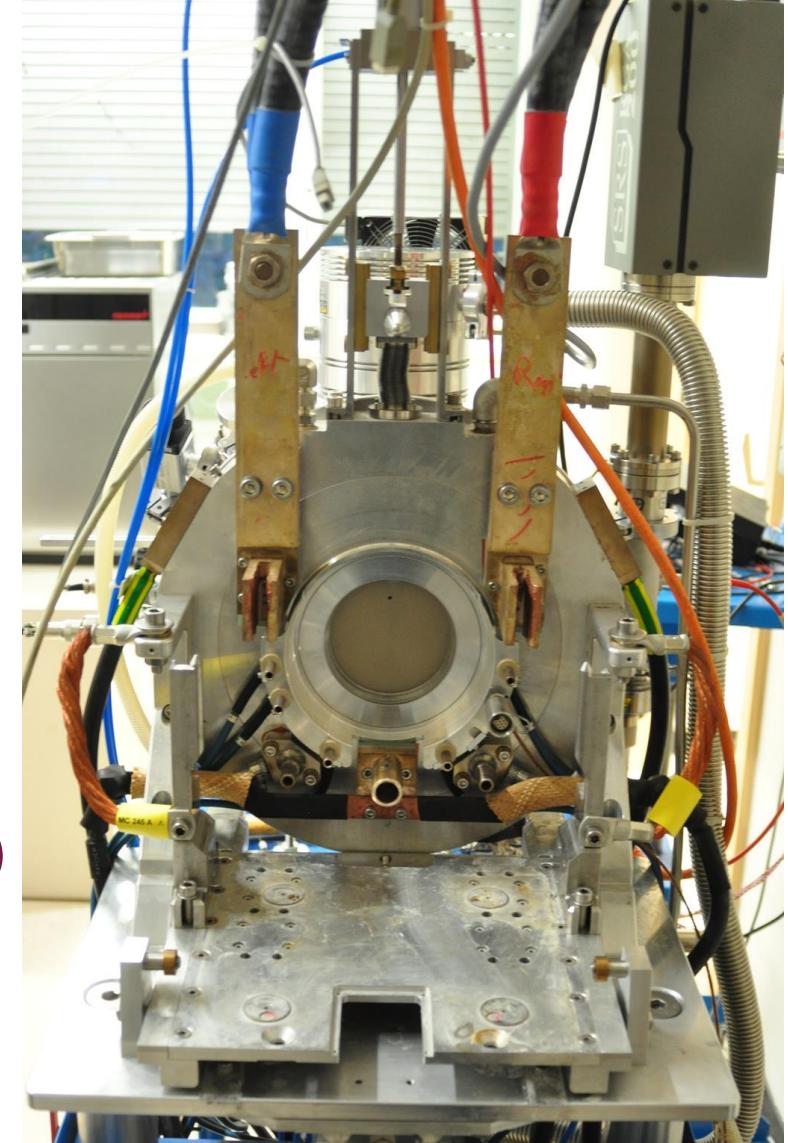

Feedthrough connections

Gas injection
Line heating

Target heating
Oven (mass marker)
Water circuit connectors

Target Configurations

Ion sources

- MK1 surface source
- VD5 plasma source
- VD7 plasma source cold line
- MK4 negative source
- ...

Target Materials

- UCx
- LaC₂
- CaO
- SiC
- ZrO
- ThO
- Ta rolls
- Ti foils
- ...

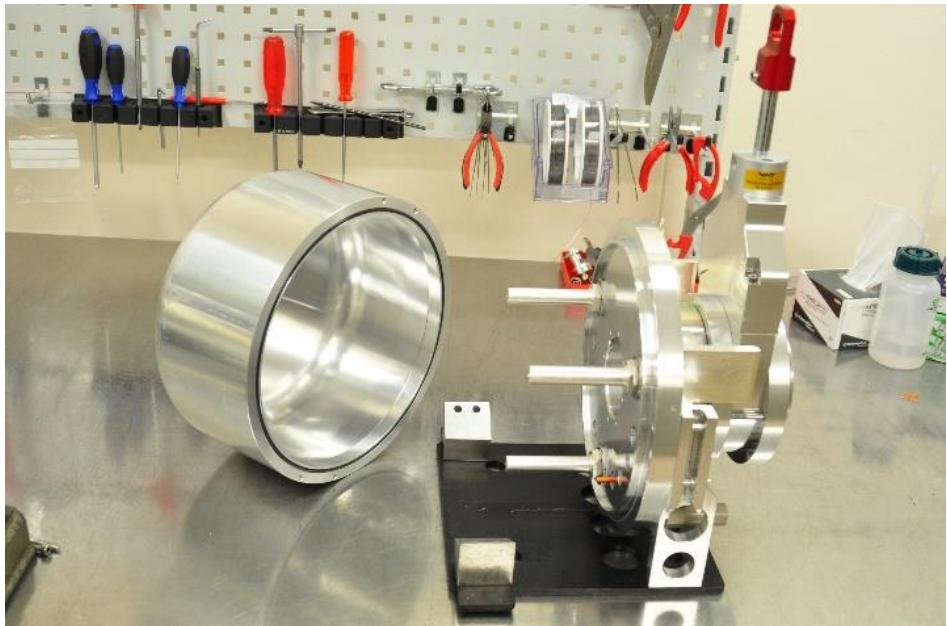

Auxiliaries

- Mass markers
- Thermocouples
- p2n converter
- Gas injection
- ...

A. Viéitez

Target assembly

Target base

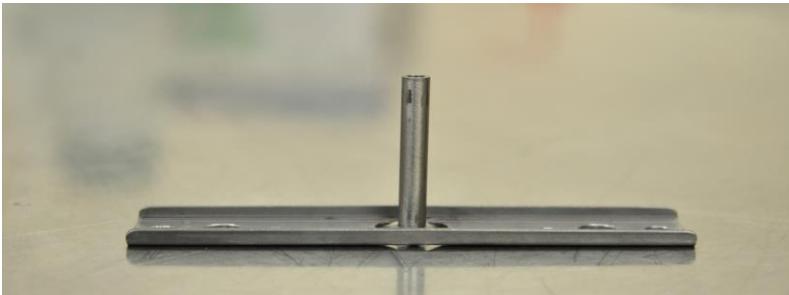

Target Container

A. Viéitez

Target assembly

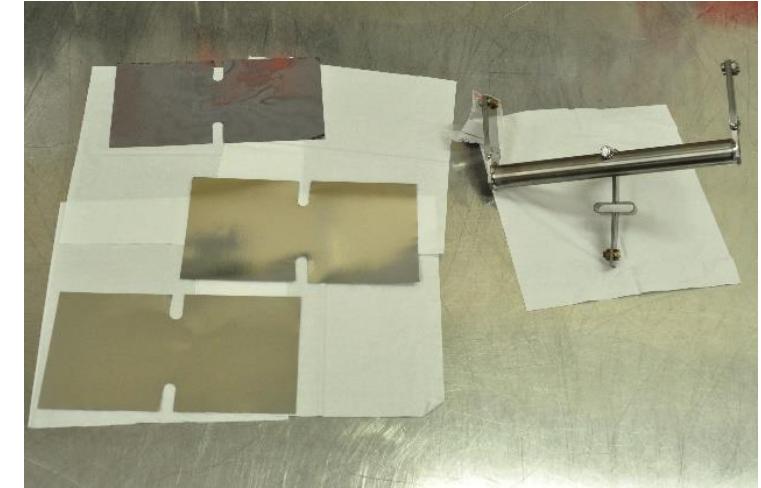

Surface source (MK1)
= RILIS hot cavity

A. Viéitez

Target assembly

Thermal screens

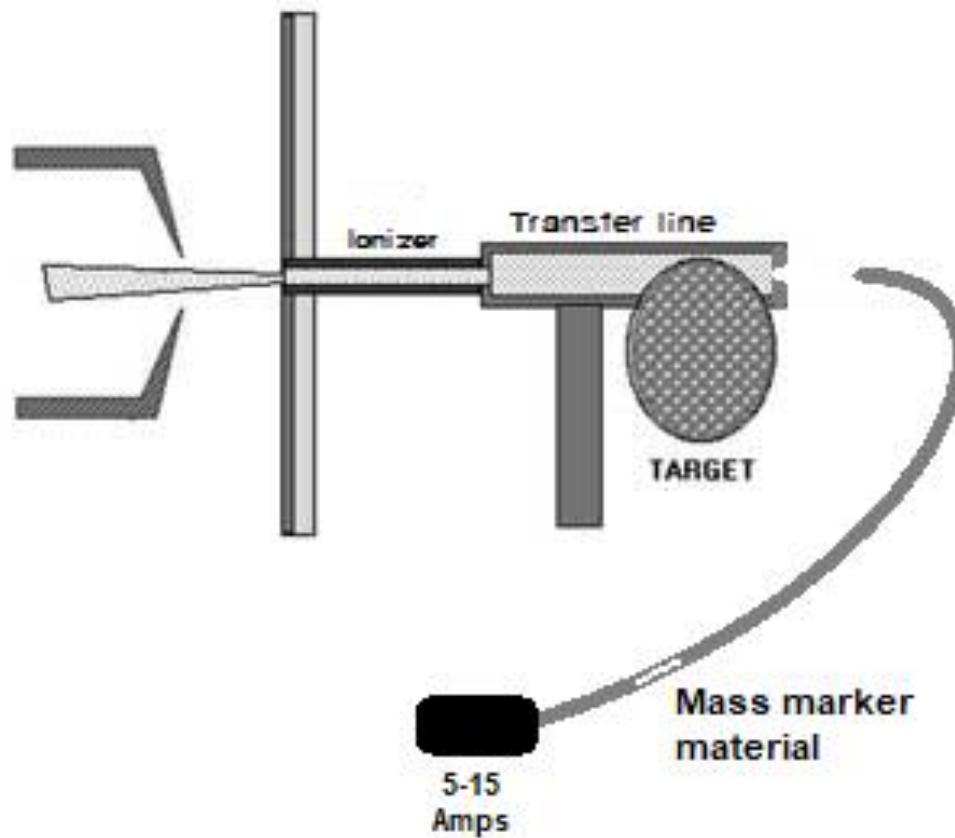

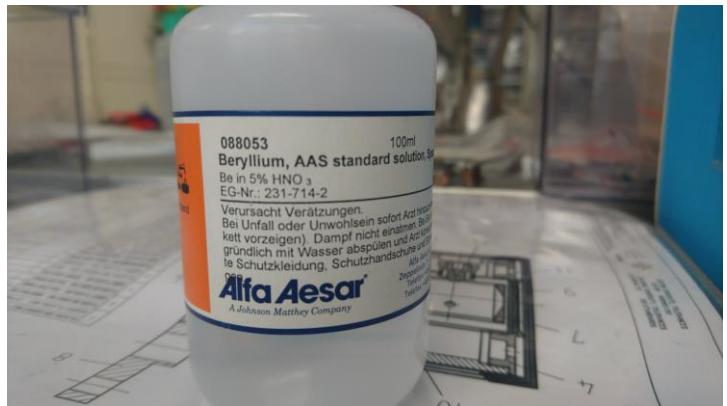

Cover shielding (Inox sheet)

Container screens (Ta, Mo, W)
A. Viéitez

Target assembly

Accessories - Mass marker

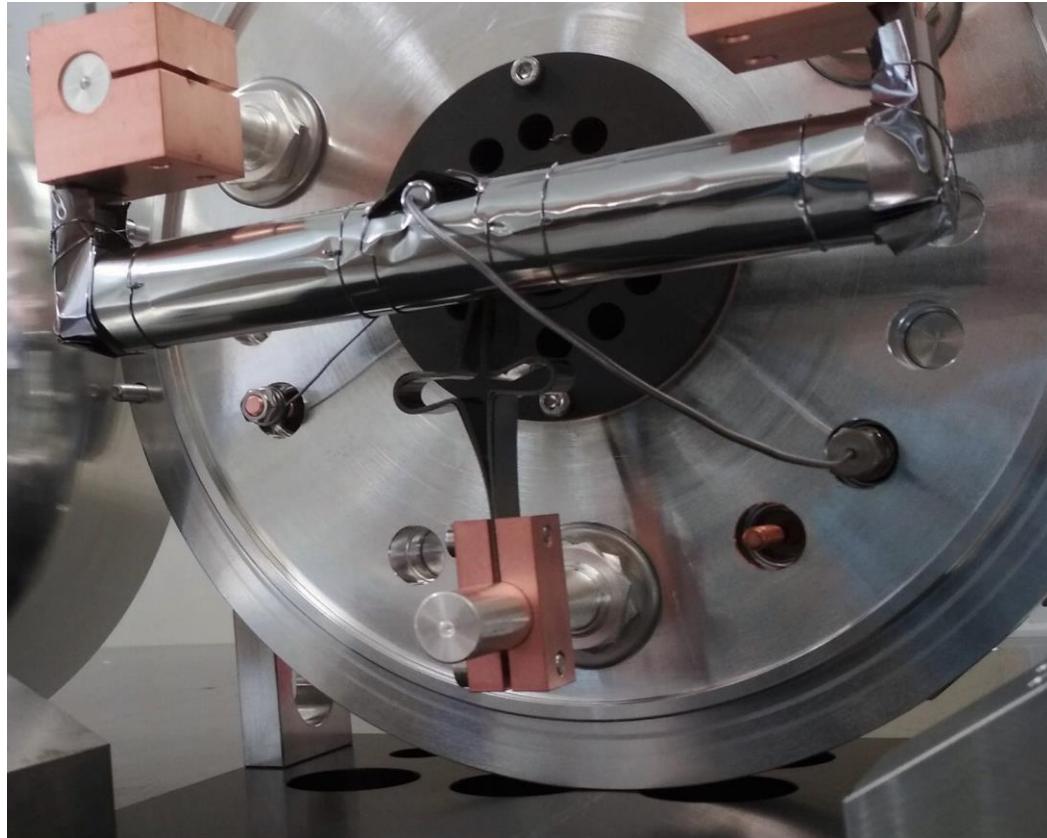

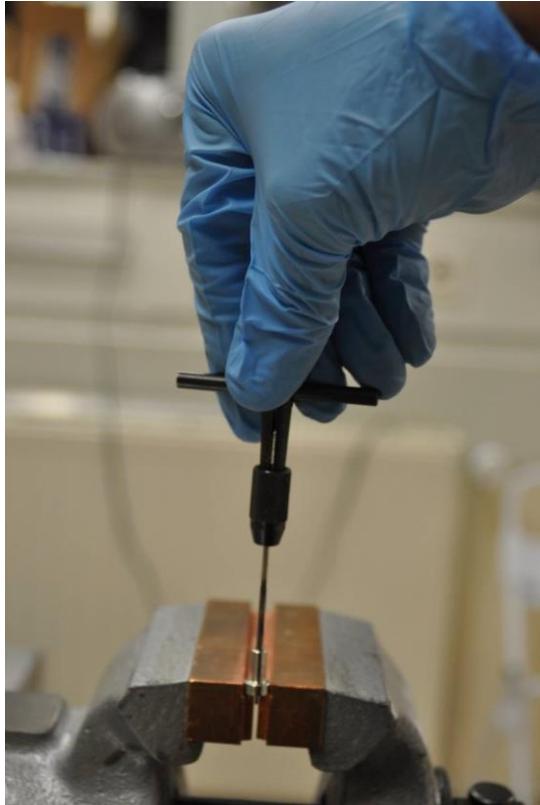

μL of standard solution used to prepare
a source of atoms

A. Viéitez

Target assembly

Accessories - Gas Injection

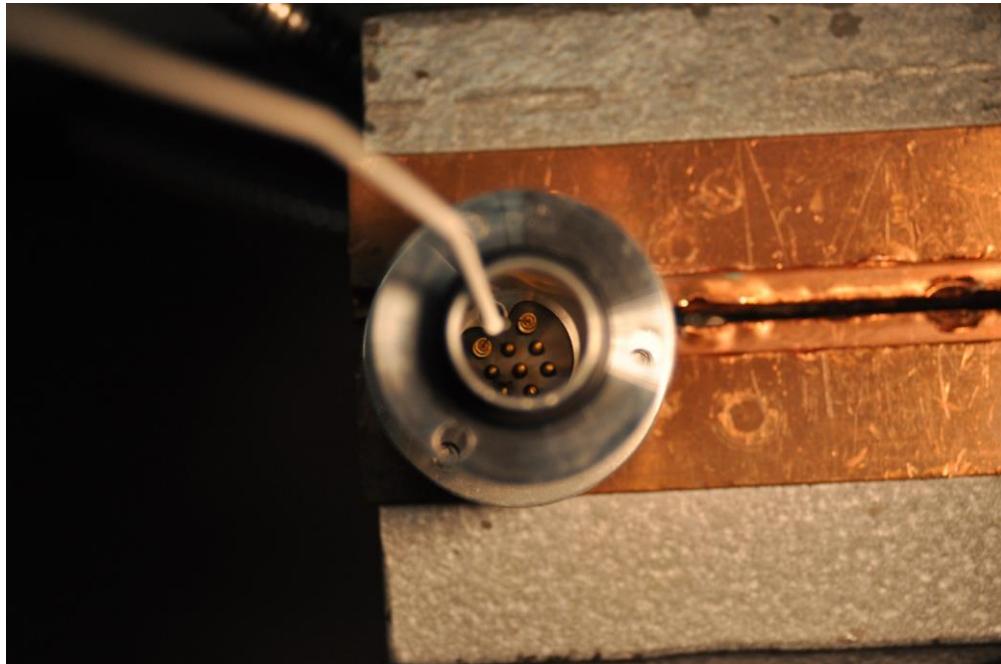

- Buffer gas for FEBIAD ion sources
- Efficiency measurement
- Add reactive gasses (SF₆, CF₄, ...) for molecular beams

A. Viéitez

Target assembly

Accessories - Thermocouple

- Multi-Pin connector (4 thermocouples)
- Important for molten metal targets and development units

A. Viéitez

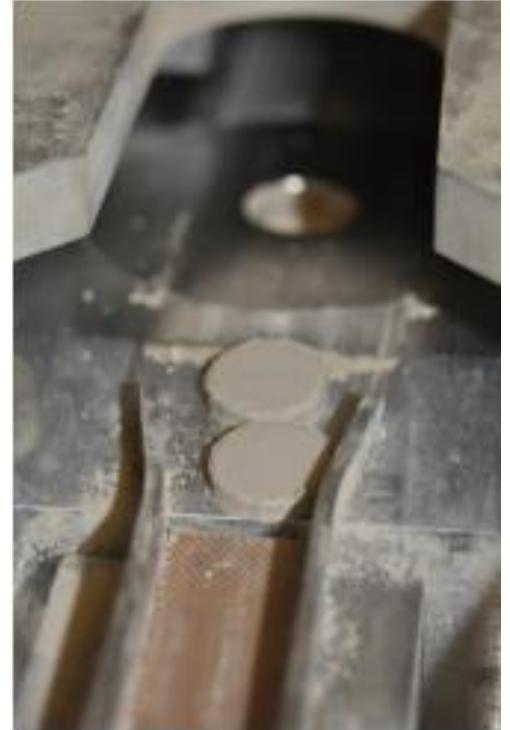

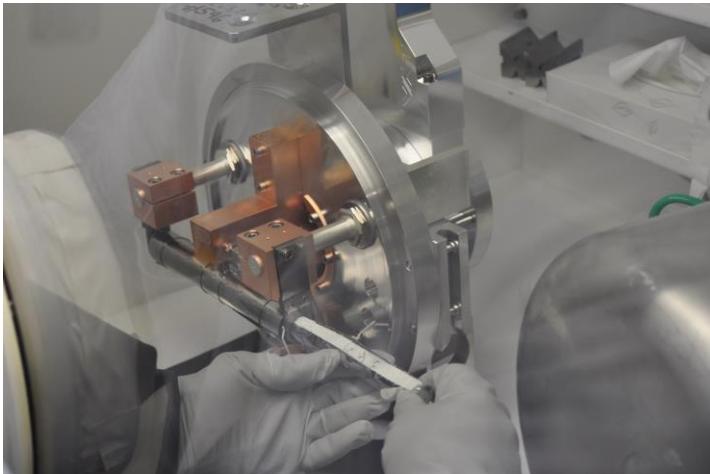

Target material production: metal foils

- Titanium, tantalum, thorium

A. Viéitez

Target material production: oxides, carbides

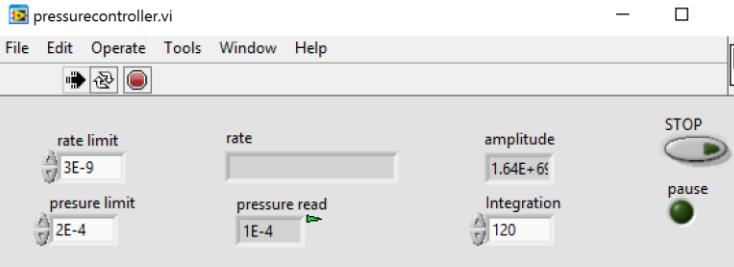

- SiC
- LaC
- CaO

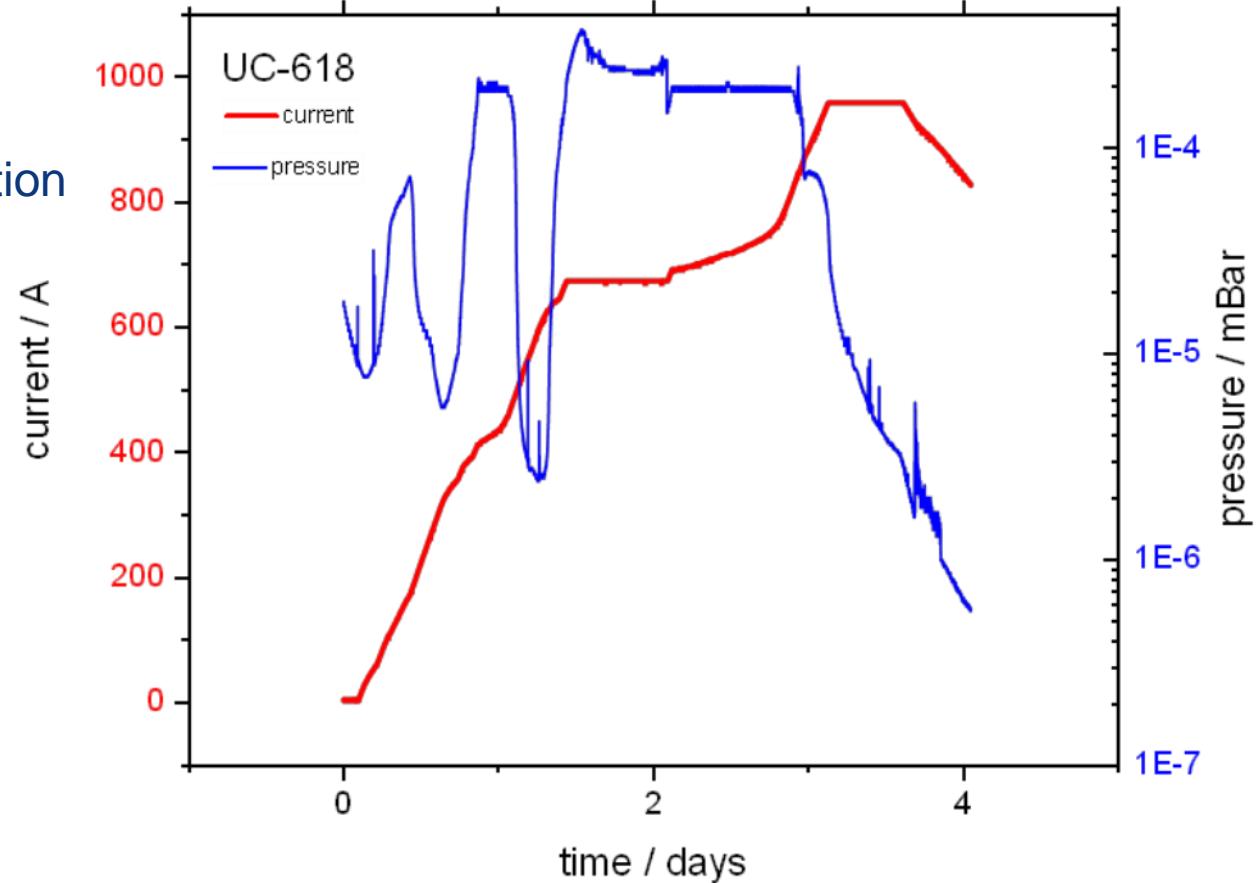

A. Viéitez

Target material production: UCx carburization

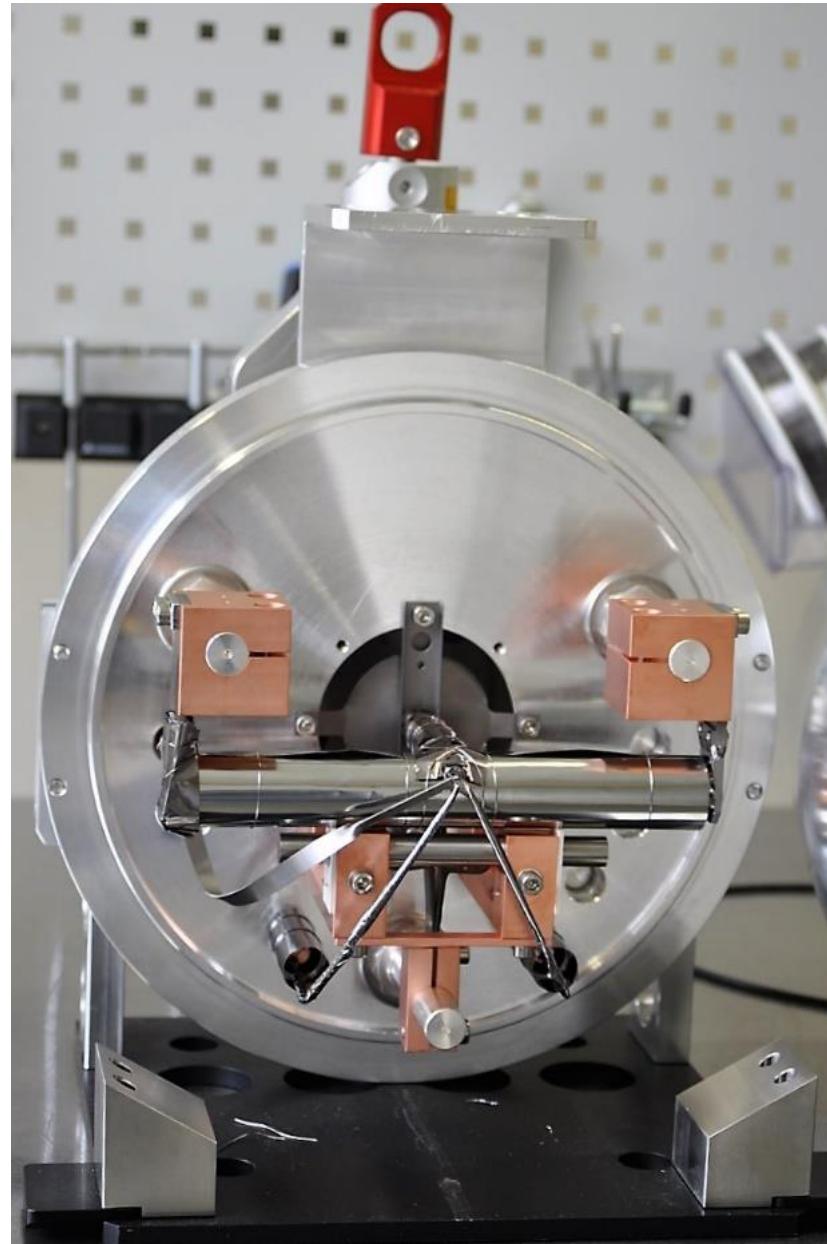

- Setting a ramp
- Set thresholds
- Start carburization

UC-618 Finished in **4 days** without human intervention
Used for UC and ThC production throughout 2018

Quality control

Visual inspection

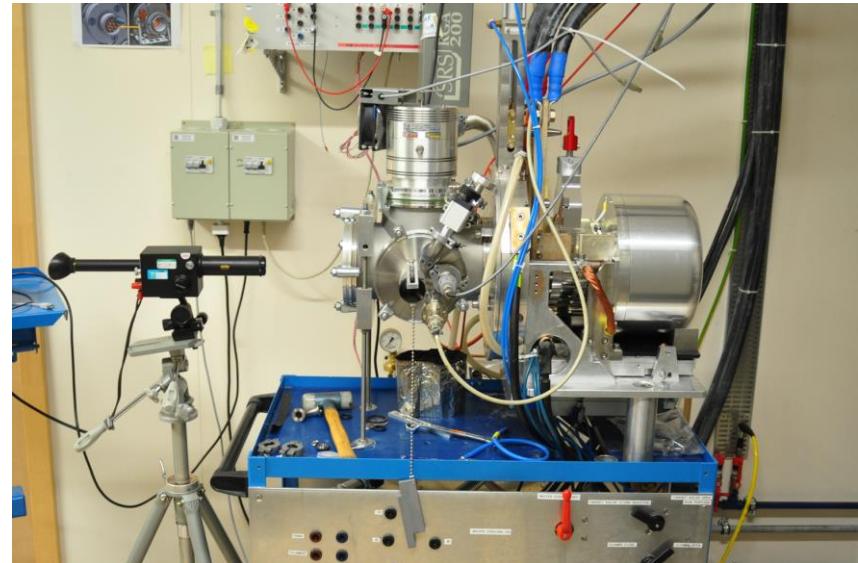

A. Viéitez

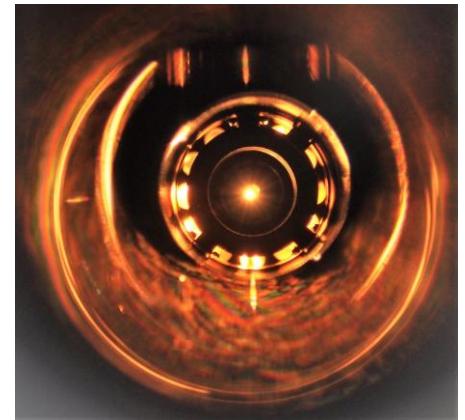

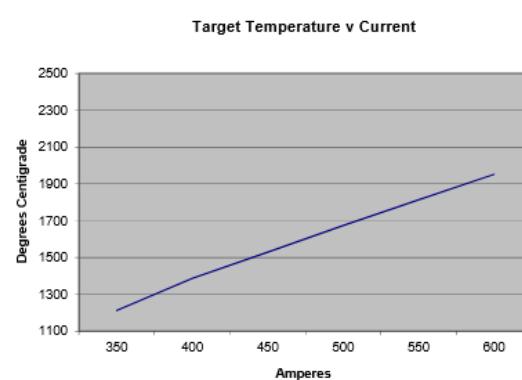

Quality control

He gas leak detection

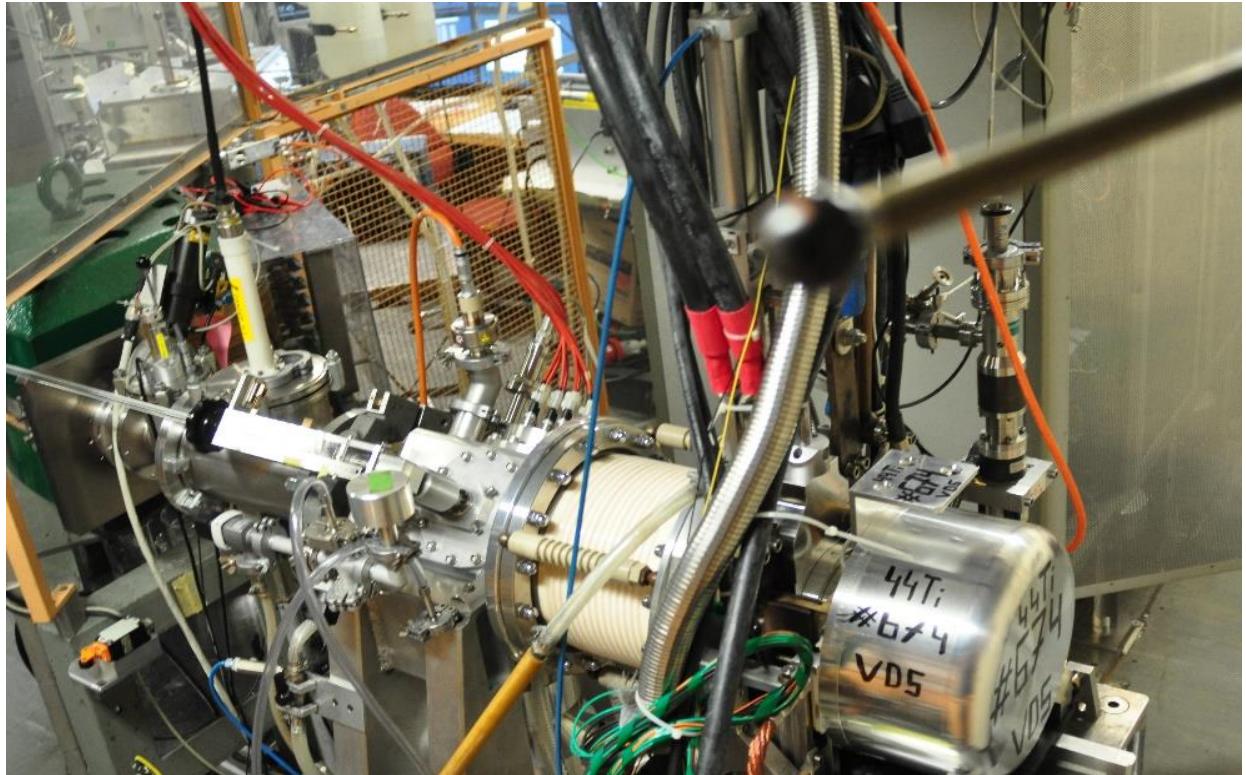

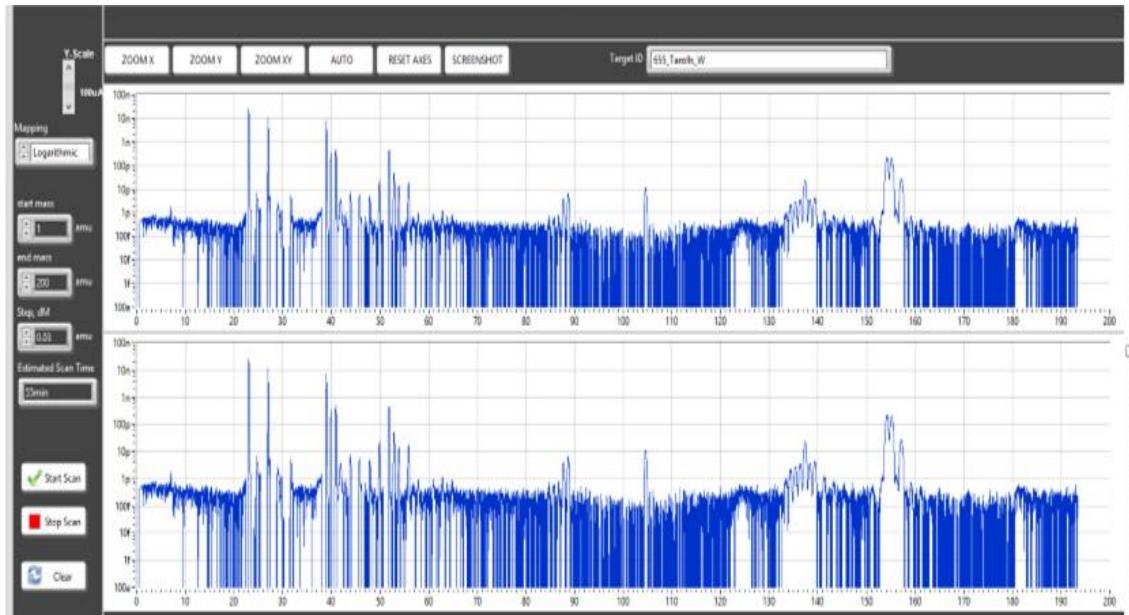

Thermal calibration

A. Viéitez

Quality control

- Targets coupled to offline 1 frontend
- Check performance of ion source
- Identify stable contaminants

A. Viéitez

Target long term storage and dismantling

Target storage shelves in ISR

Paul Harwood

Hot cells

- dismantling of targets
- Post mortem analysis

Microtomograph for post mortem analysis

ZEISS METROTOM 1500/225 kV

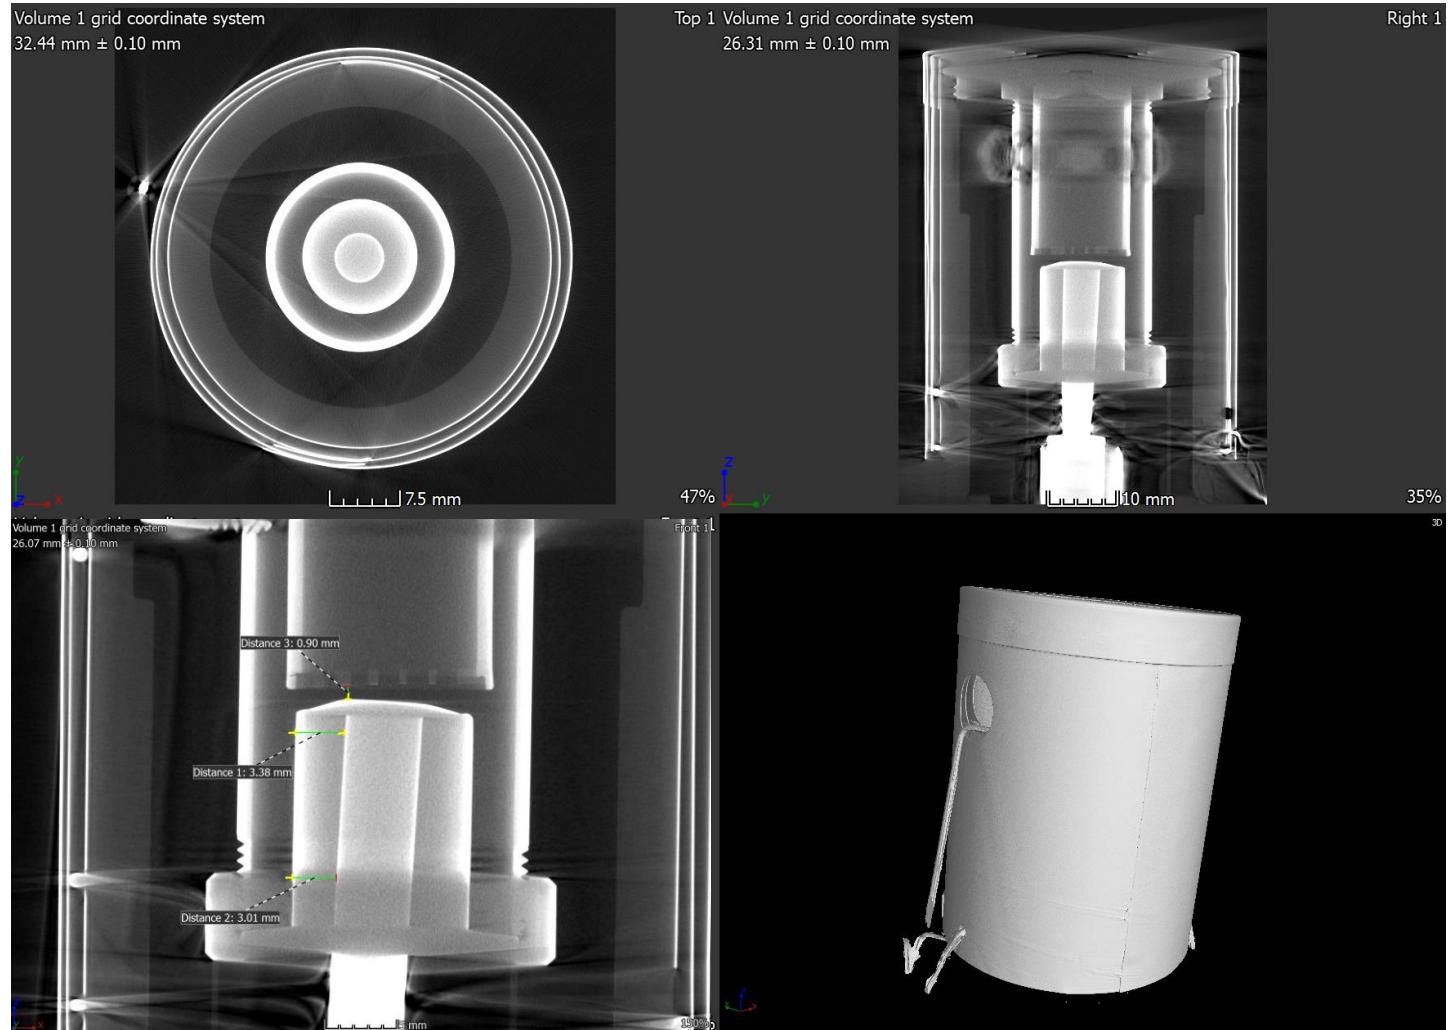

- Non destructive 3D reconstruction by X-ray computed tomography

ISOLDE Target Production 2018

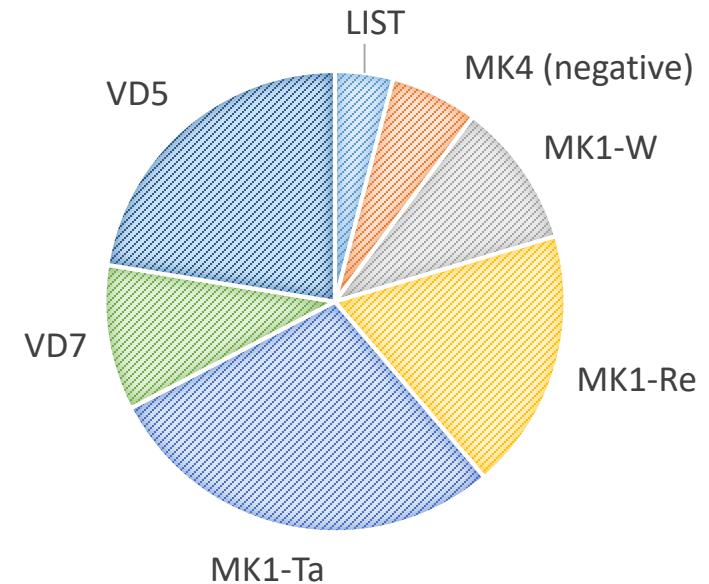

TARGET DESTINATION

TARGET MATERIALS

ION SOURCES

Total targets assembled end of 2018 : 49

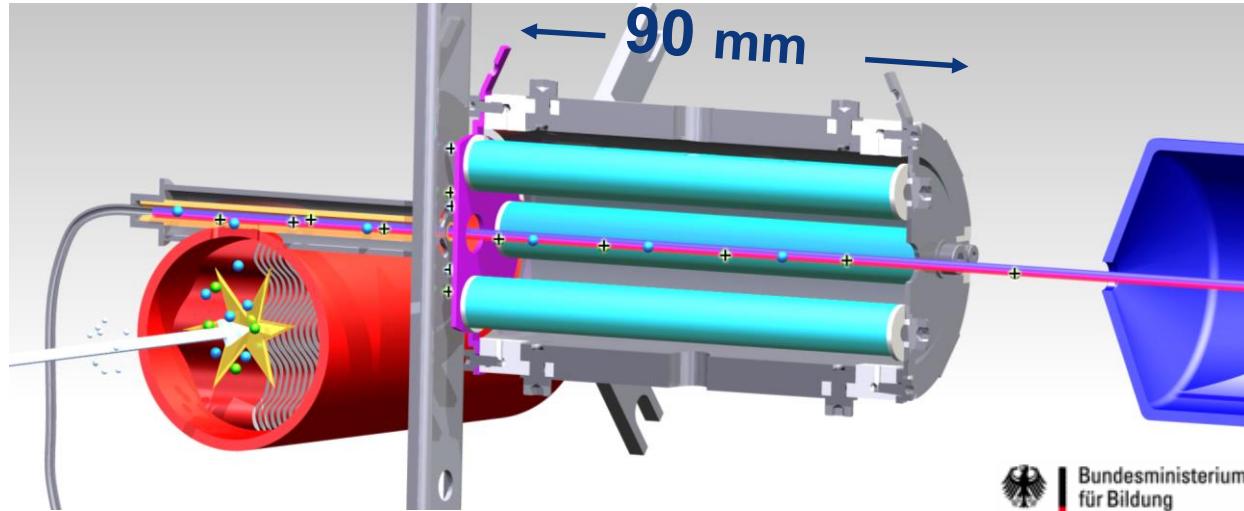

- Delivered to ISOLDE: 29
- Delivered to MEDICIS: 10 + 2 in December
- Used for development: 8 (16%)

- **10 different materials**
- Mostly carbides and metal foils
- Most popular: **uranium carbide**

- **7 different ion sources**
- LIST and negative ion source back in action

LIST v 1.0

HFS studies of polonium / suppression of francium (IS456, September 2012)

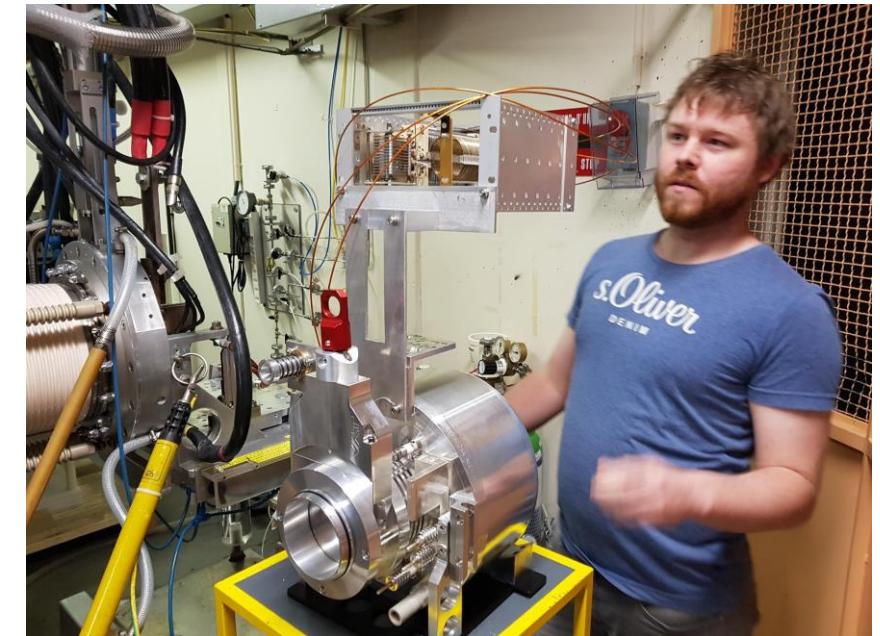

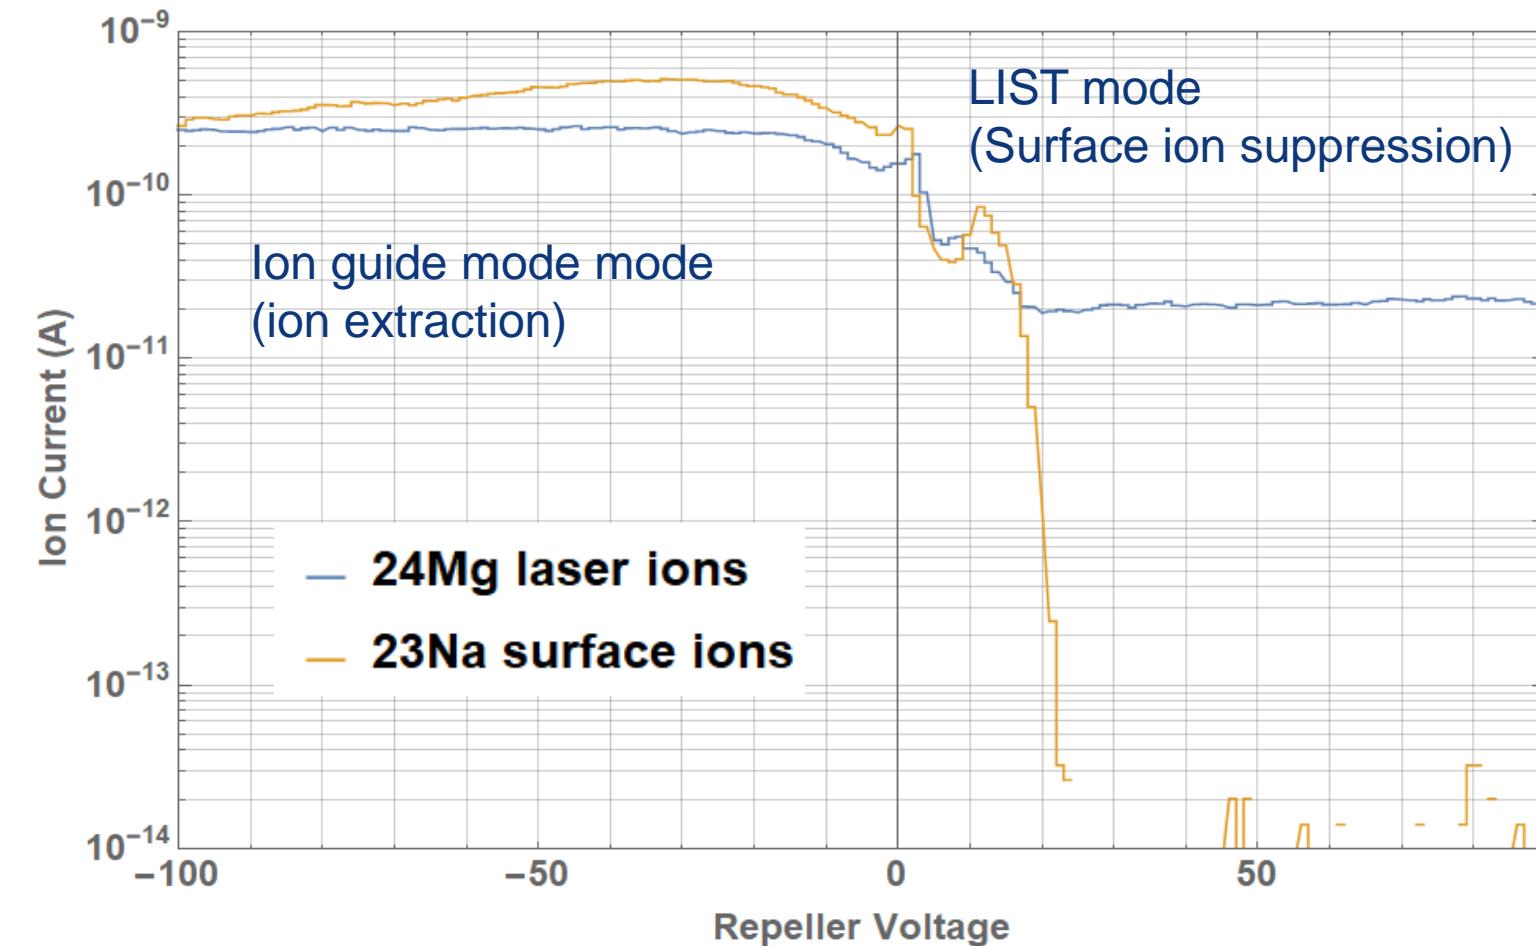

Isobaric suppression > 1000 , efficiency loss ≈ 50

On-line implementation and first operation of the Laser Ion Source and Trap at ISOLDE/CERN, D. Fink et al., NIMB 344, 83-95 (2015)

In-Source Laser Spectroscopy with the Laser Ion Source and Trap: First Direct Study of the Ground-State Properties $^{217,219}\text{Po}$, D. Fink et al., PRX 5, 011018 (2015)

Results: 90mm „standard“ LIST /w 2 repeller electrodes @ ISOLDE

Final on-line characteristics with SiC target:

- Suppression factor: **1E6** (^{21}Na)
- Laser ion loss factor: **27** (on ^{22}Mg)
- No ^{22}Na seen in IS614 detectors

Boron fluoride beams

Principle:

Volatileization of refractory boron by injection of SF₆ gas

First prototype #499

- Small gas leak (3.7e-5 mbar L / s)
- Absence of TaF_x and SF_x in mass spectra

→ Unit did not produce BF_x beams
no fluorine saturation

Second prototype #513

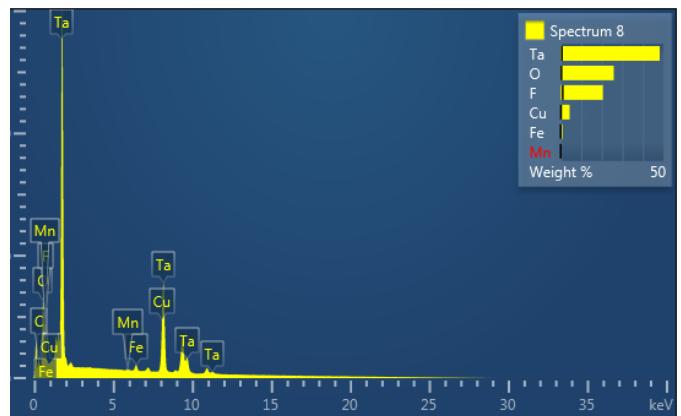

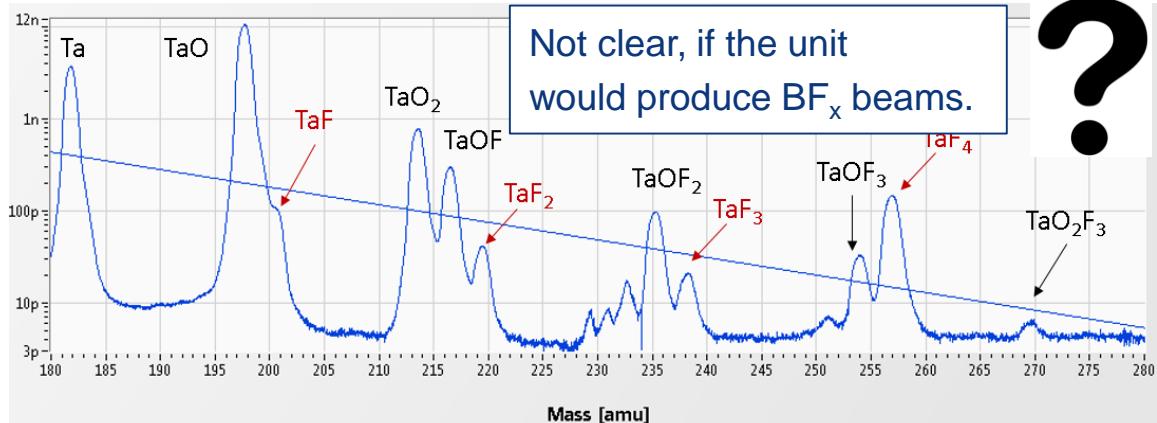

- Increased leak (1.84e-4 mbar L/s)
- Strong TaF_x and SF_x peaks
- No TaO peaks

→ Stable and intense 8BF_x beams

First production unit #606

Despite high injection,
low fluorination, and presence of oxygen. H₂O or air leak?

TaO_xF_y deposits in target

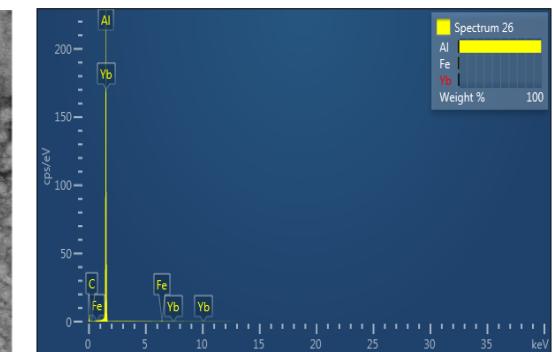

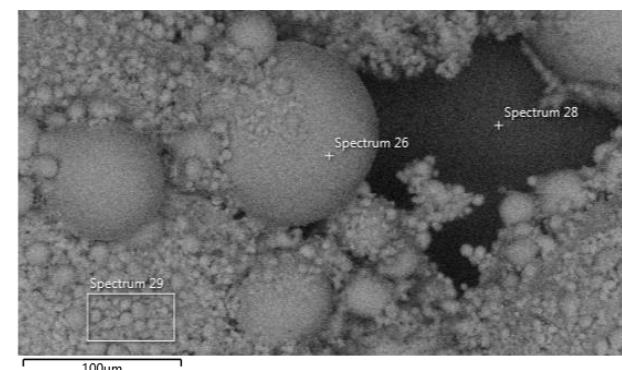

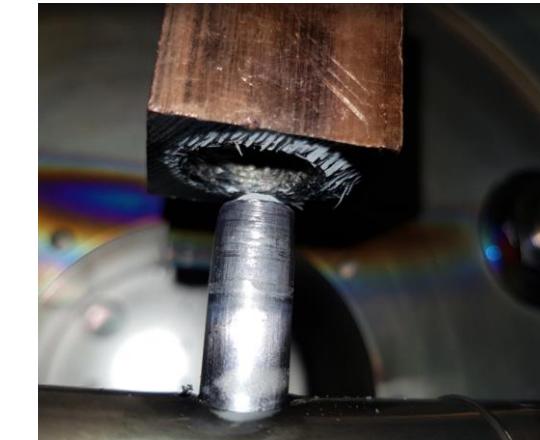

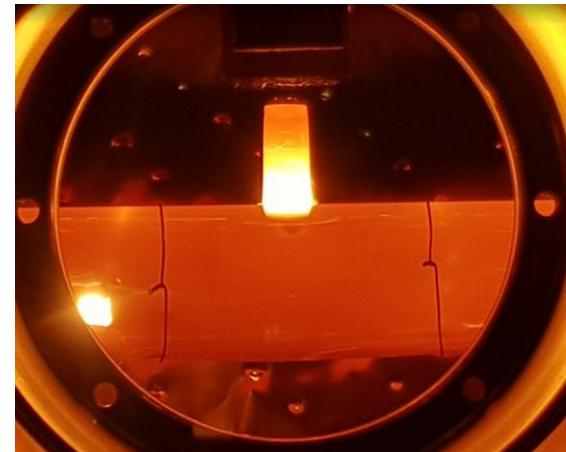

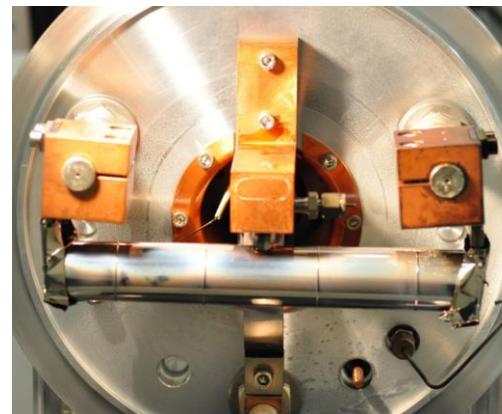

Gas line
rupture

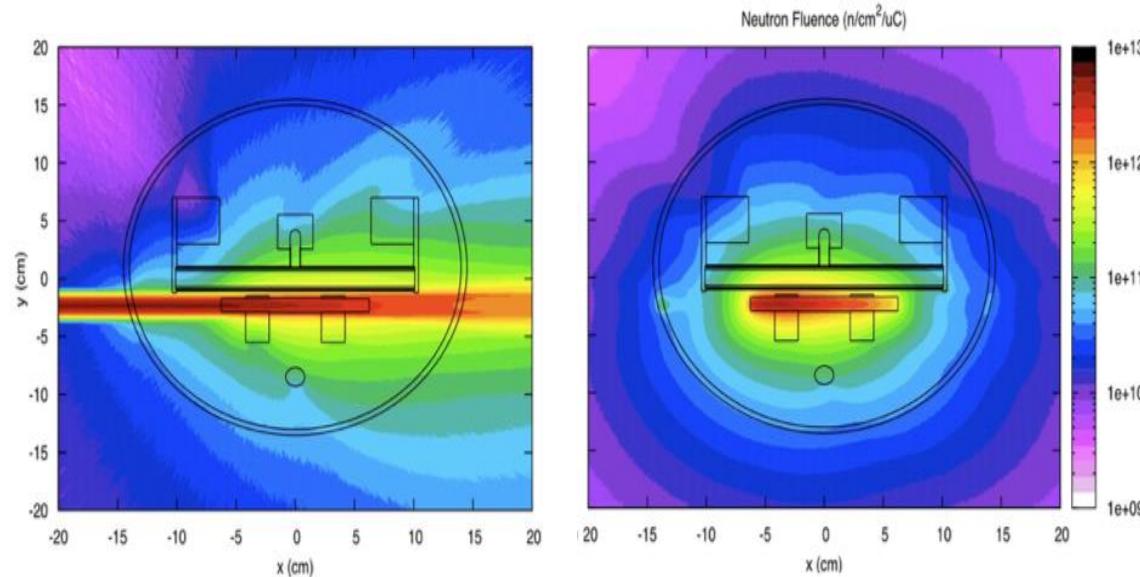

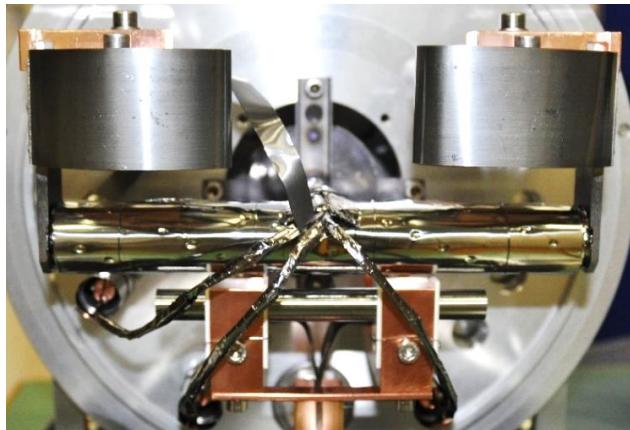

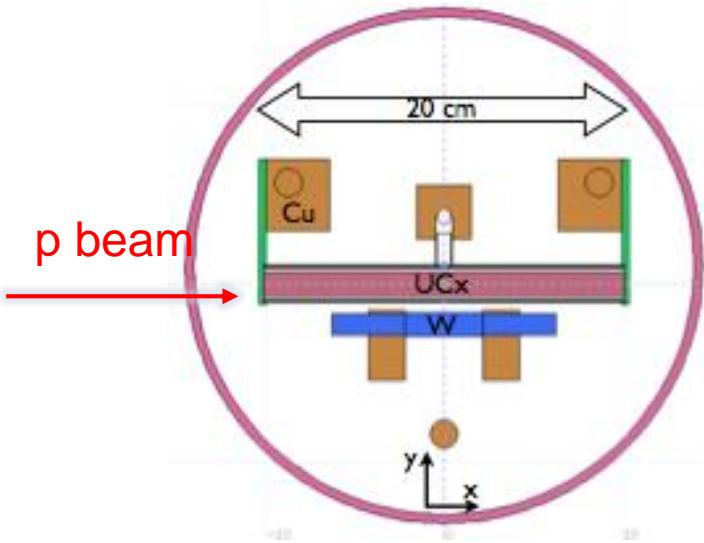

Target #606 -> #650

MWCNT for ${}^8\text{B} {}^{19}\text{F}_2$ beams at IDS

- 2017: #606 Target could not be delivered, #513 was used
- No infrastructure available to handle C nano tubes
- Decided to recuperate charge from #606 for #650
- Disassembly: transferline found clogged with AlF
- Target outgassed to remove contaminants
- Found macroscopic amount of Aluminum in transfer line
- Successfully used #650 for IDS run
- Factor 10 yield increase compared to #513
- CF4 can be used
- > **#650 rescheduled for HIE ISOLDE,**
 - **line broke, used #513 again**

p2n-converter

Brings high purity neutron-induced fission fragments

500 MeV
100 μ A
cw
50 kW

1.4 GeV 2.0 GeV
2 μ A 6 μ A
pulsed pulsed
2.8 kW 12 kW

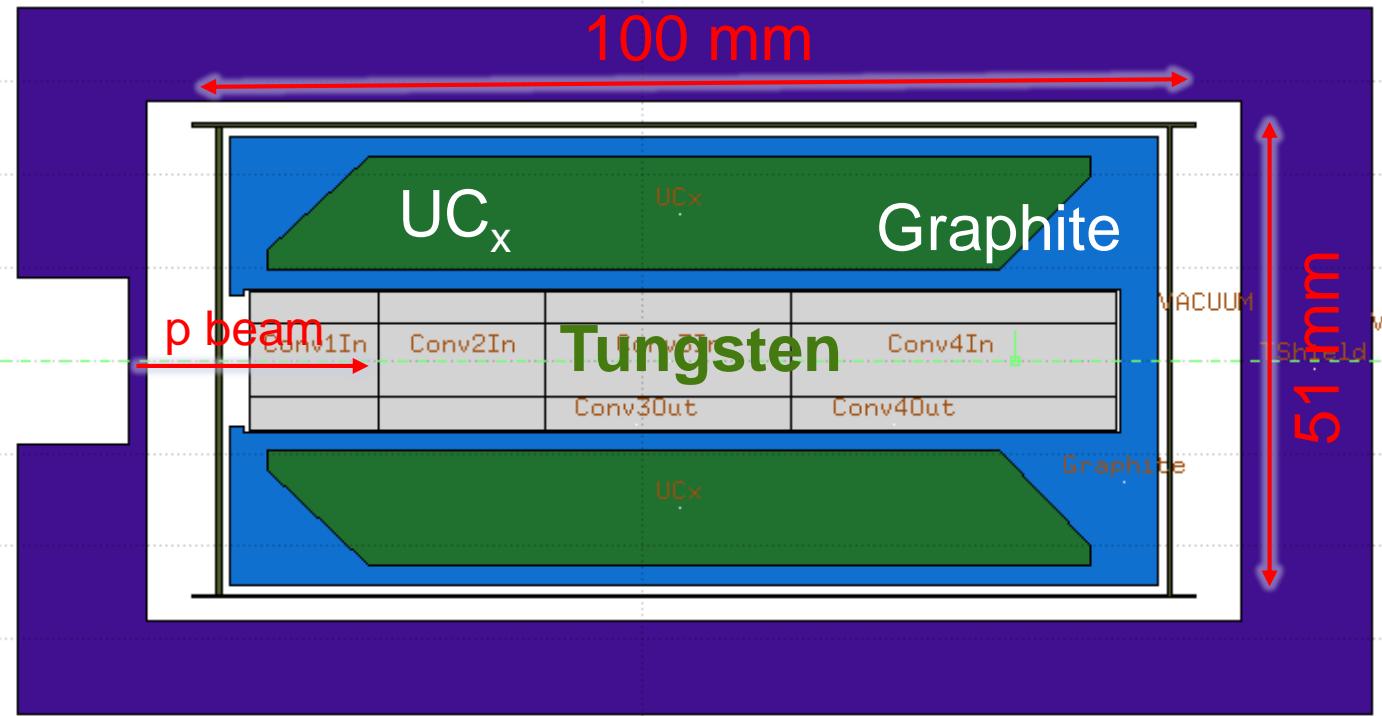

Collaboration started to design two p2n-converters:

- Improve the one of ISOLDE
- Design one for TRIUMF ISAC

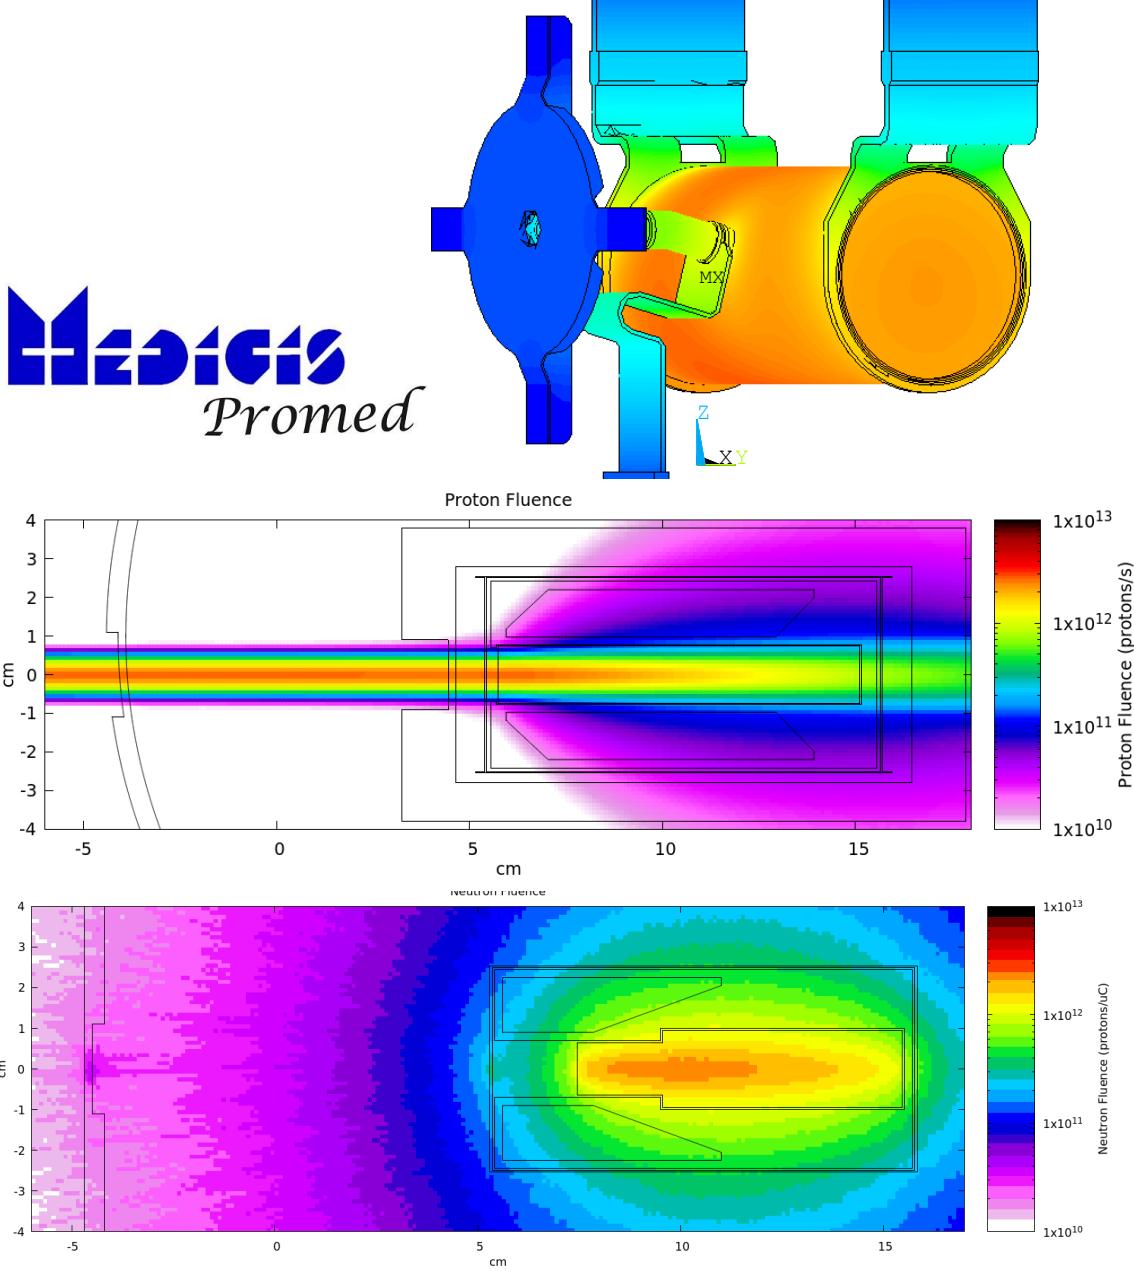

L. Egoriti, et al. (from TRIUMF)

p2n-converter

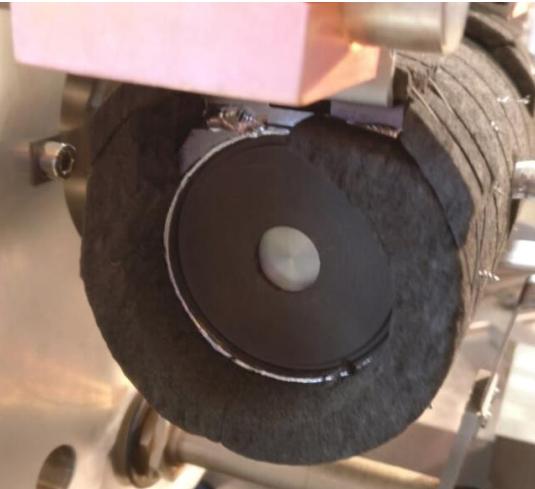

- Normal shielding – several metal foils stacked
- **New shielding:** Sigratherm material – 1 cm thick

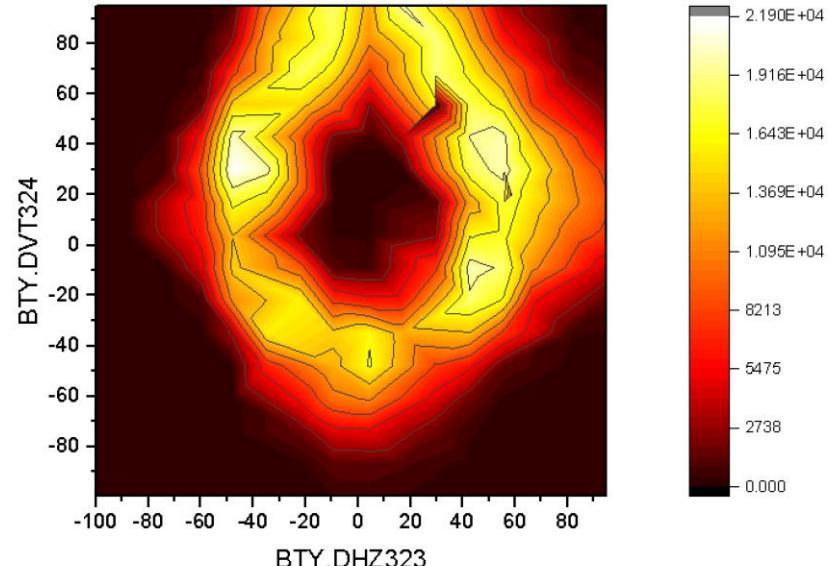

Converter will act as internal heat source

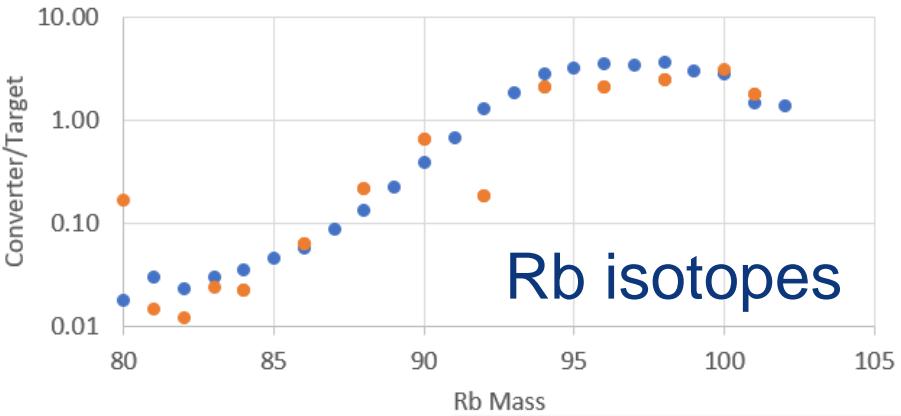

p2n-converter

Full proton scan

Converter vs Target

Rb isotopes

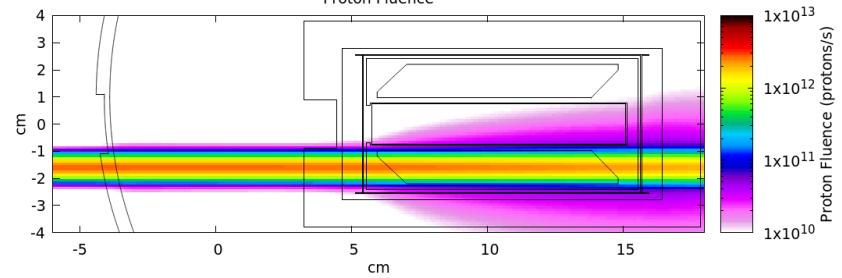

Data under analysis

Very short-lived
isotopes extracted!

- Theoretical
- Experimental

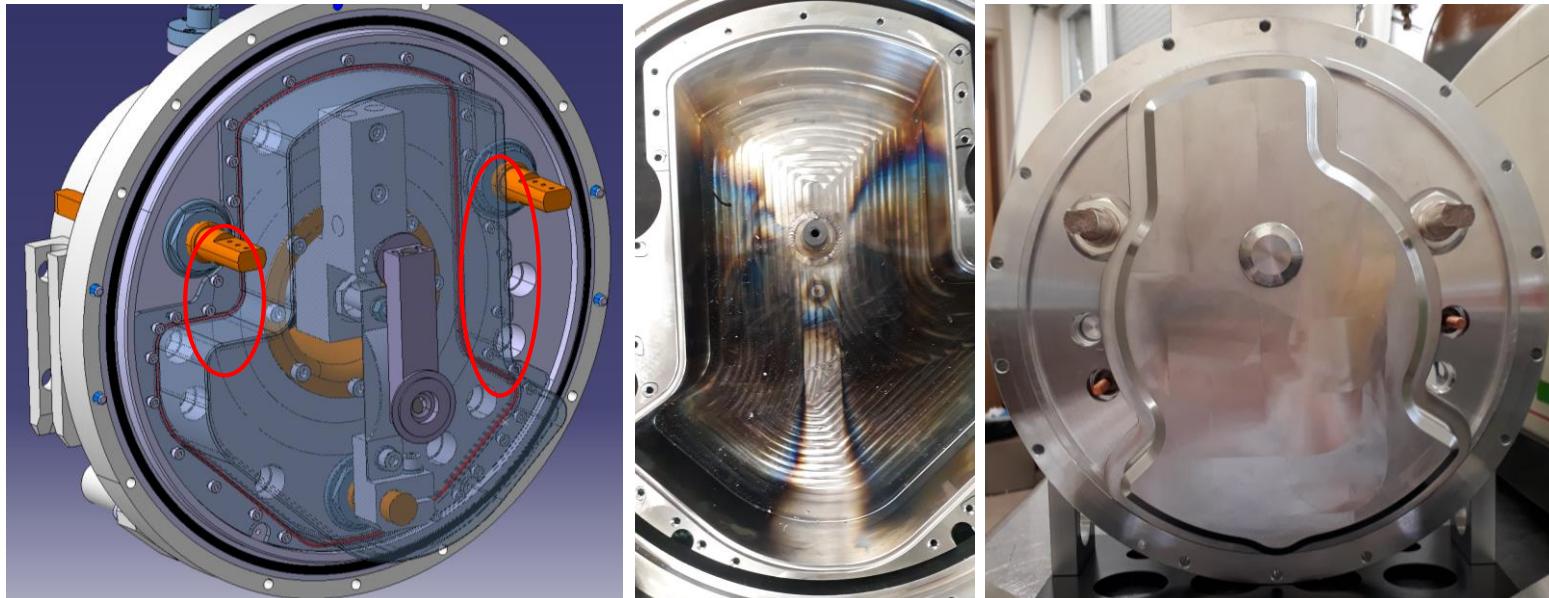

Isotope data:

- Cs, Rb, Fr
- Laser ionized - Ga, Zn, In
- More than 100 yields extracted
- Protons on target and converter

LIEBE: offline commissioning

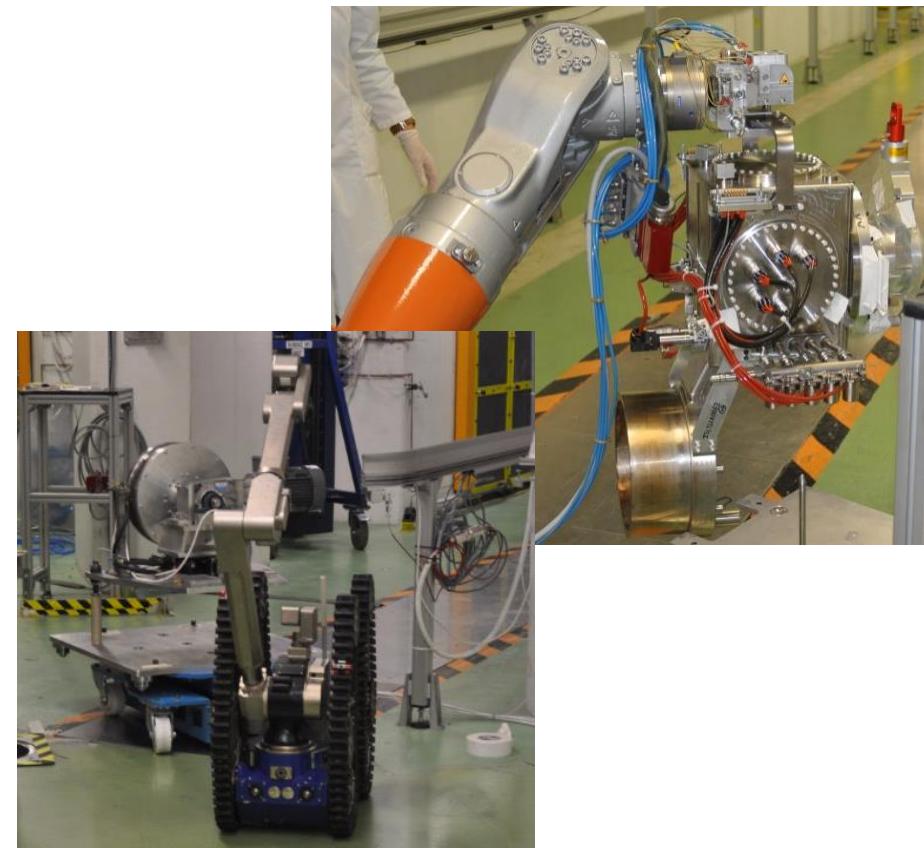

Leaks on the vessel containing the ion source impeded further offline commissioning in 2017

Successful replacement of the target base.

Standard operation of the VADIS ion source achieved.

Full installation tests on GPS front-end during YETS2018

Ferran Boix Pamies, et al.

LIEBE: offline commissioning

- Full operational tests with LBE on the offline mass separator

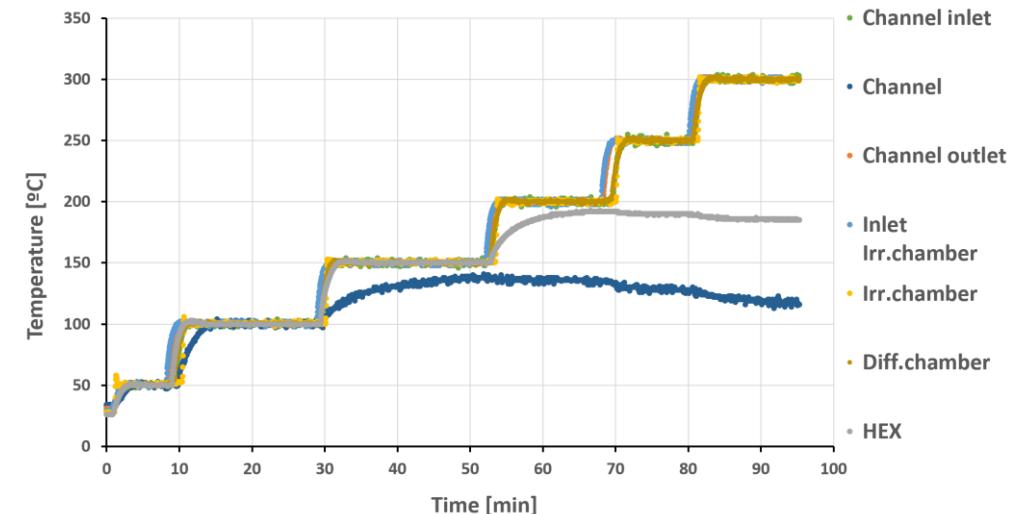

Unsatisfactory results:

- Insufficient heating power on channel and HEX
- Plugs of solid LBE lead to spilling of the liquid metal → not ready before LS2

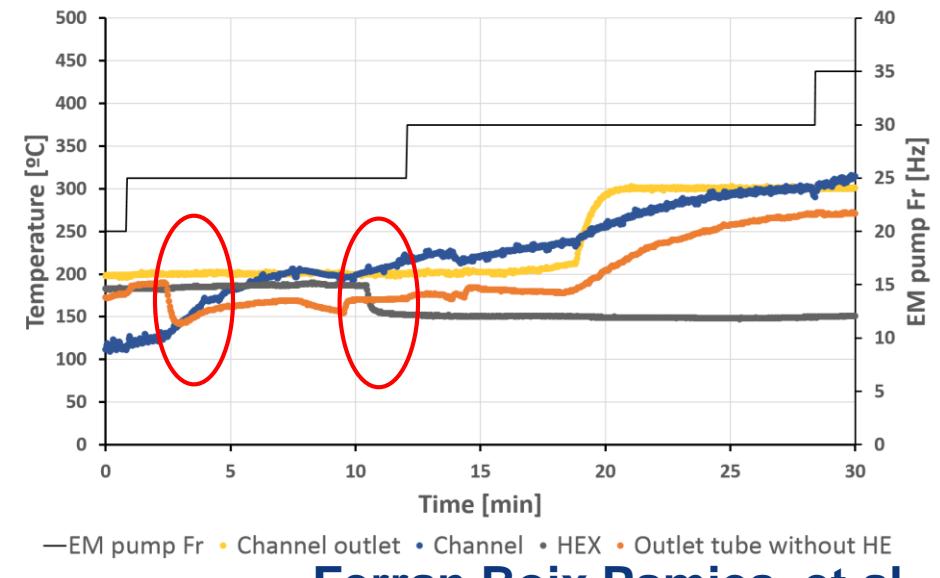

Review & next steps:

- Heating element redesign and replacement
- Further hydraulic tests of the loop plus EM pump
- Can LIEBE with molten Lanthanum cover 100Sn region for HIE ISOLDE ?

Outgassing sequence

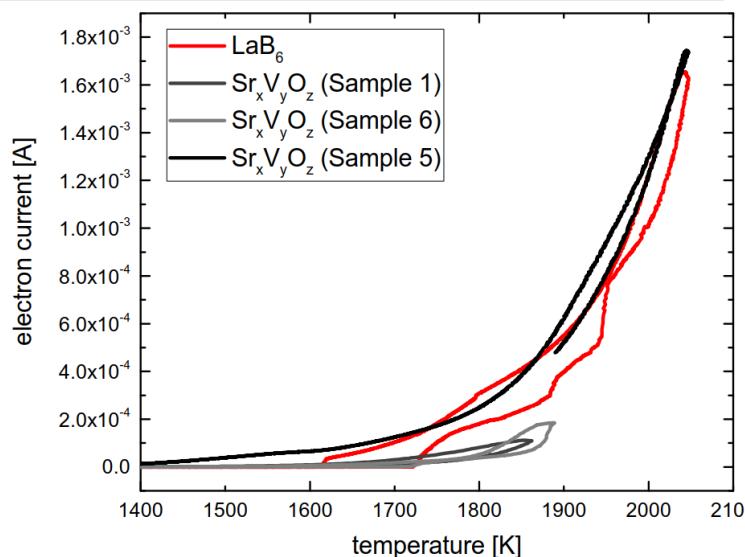

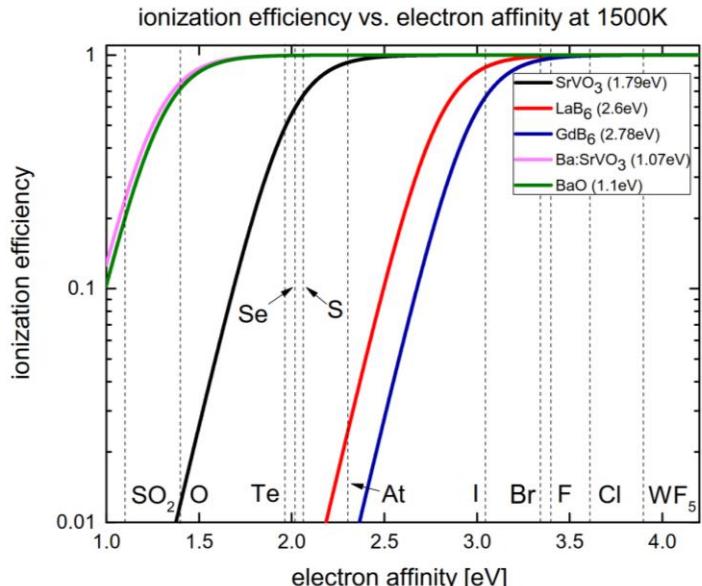

De-plugging detected during post-analysis

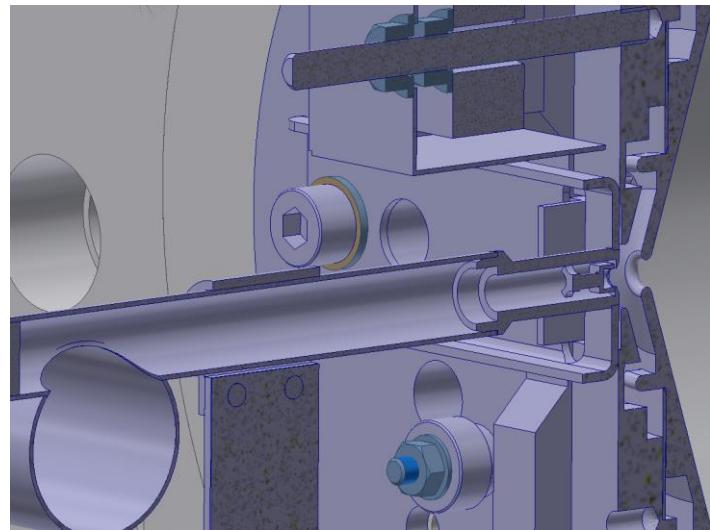

Ferran Boix Pamies, et al.

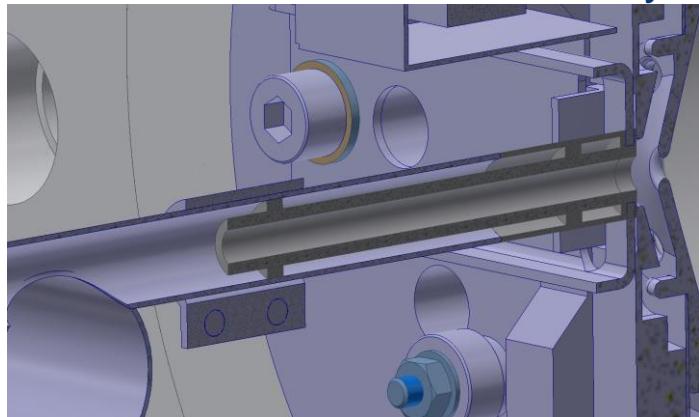

Low work function materials for negative ion production

MK4 – Pellet source

Tubular low workfunction cavity

Improvement of ionization efficiency:

- Elements with low affinities are not efficiently ionized by LaB₆
- New compounds needed:
 - SrVO₃ with expected work function <2eV

First steps:

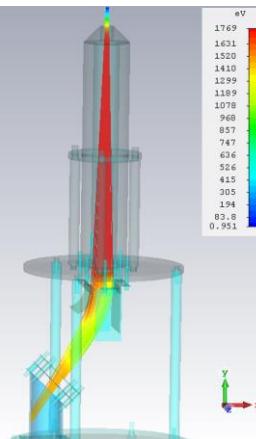

- Production of suitable candidates
- Electron emission tests with LaB₆ as benchmark
- Performance studies

Next steps:

- Compare geometries offline

D.Leimbach: Presentation at 12:20

Dedicated test stand for ion source development

ISOLDE calibration stand

Main features:

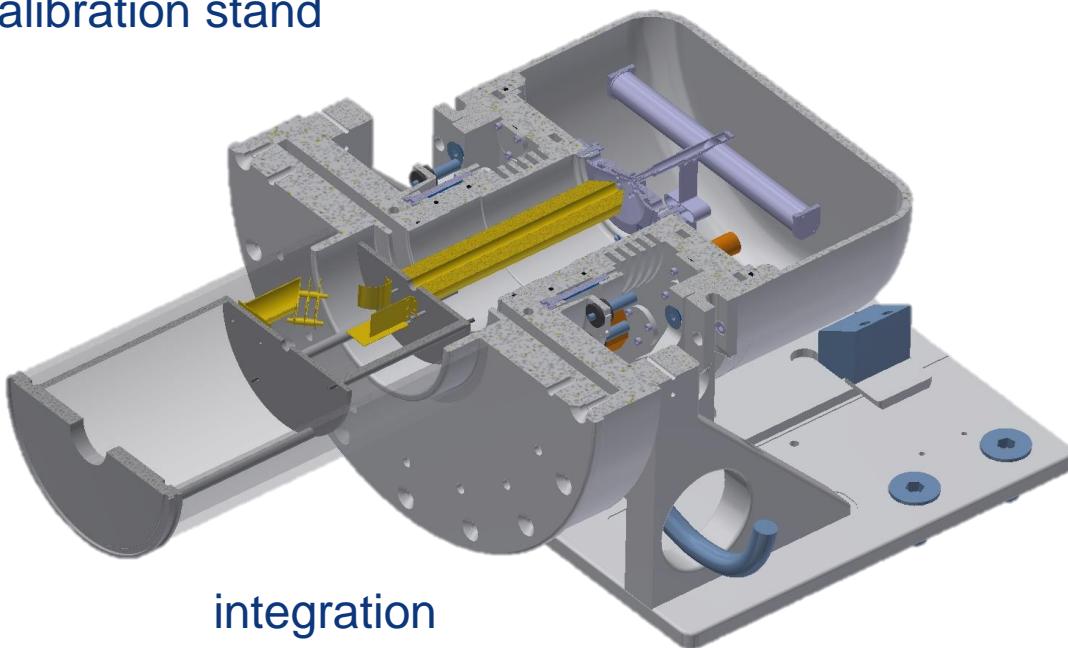

- ion **beam extraction** and detection
- residual gas analyzer (RGA)
- automated control and data recording (**LabVIEW**)

First application:

- **negative ion source** development
- investigation of source poisoning and regeneration

Future plans:

- long-term performance studies
- thermal stress tests
- destructive tests
 - **operational limits**
 - **failure mode analysis**

integration

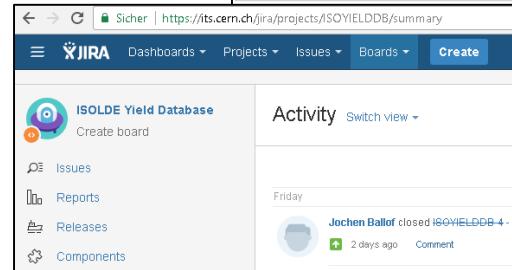

D.Leimbach

ISOLDE Yield Database YYDB(<https://isoyields2.web.cern.ch>)

Target Unit	
Target Number	UC385
Material	U Carbide
Ion source	VADIS Cold Plasma VD7
Transferline	Water cooled
Total thickness	50.00 g/cm ²
Source efficiency	22%
Target condition comments	F contam.
Target temperature	2273 K
Source temperature	2073 K
n-conv. used	No
Laser status	Laser off

Secondary beam	
Yield Id	63
Isotope	204g Rn (1.24 m ³)
Yield	9.00e+6 uC
Method	B

The screenshot shows a web-based application for managing nuclear reaction yields. The top navigation bar includes links for CERN Accelerating science, Sign in, and Directory. A banner at the top right indicates the version is 0.1.0 (2020-08-22) built on 02.11.2021. The main title is "ISOLDE Yield Database" with a "Development Version" note. On the left, there are two sections: "Yield information" and "In-target production". The "Yield information" section has dropdown menus for "Yields by Element", "Yields by Mass Number", and "Yields by Target Type". The "In-target production" section has a dropdown menu for "ABRABLA". The central part of the page displays a table titled "ABRABLA In-target production - Uranium Carbide". The table has columns for "Element" (U-235, U-238), "Reaction" (Ar-44, Ar-46, Ar-47, Ar-48, Ar-49, Ar-50, Ar-51), "Yield" (in fm²), and "Statistical Uncertainty" (in fm²). The data is presented in a grid format with color-coded cells based on yield values.

The screenshot shows the Target Unit software interface. The top section displays target properties: Target Id (3637), Target Label (Zr Mig.0543), Target type (Zr Oxide), Ion source type (Hot Plasma), and Transferline type (Hot). It also shows the 'Components of the Target material' table with Zr as the element, mass no. 91, thickness 6.3 g/cm², stoichiometry 2, and foil thickness 1. The bottom section shows 'Yields' for two entries. The first entry has a yield of 3.20E-06, method T, and supplied gas CF4. The second entry has a yield of 1.02E+08, method U, and supplied gas He. A graph on the right plots 'Release Rate (1/s)' against 'Time (s)', showing a sharp initial peak followed by a decay.

Features

- CERN SSO
 - New Database design
 - In target production (ABRABLA, FLUKA)
 - Release curves available
 - More target details visible
 - Issue tracking

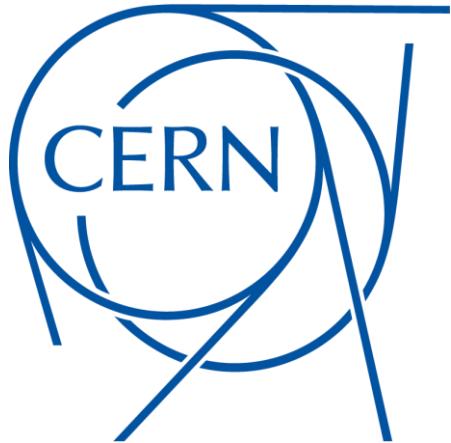

Philosophy

- All measurements (TISD, USERS) get entered into YYDB
 - Manually change attribute (measured -> validated -> published)
 - Attribute determines visibility

Future

- Web based interface allows entering of yields to registered users
 - Add yield prediction
 - Establish link to CRIBE database

J.Ballof

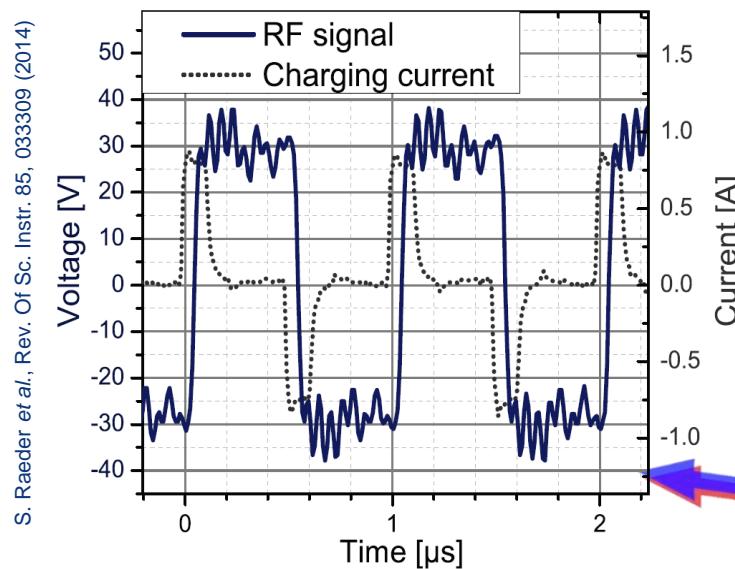

ENGINEERING
DEPARTMENT

Thanks to the TISD team

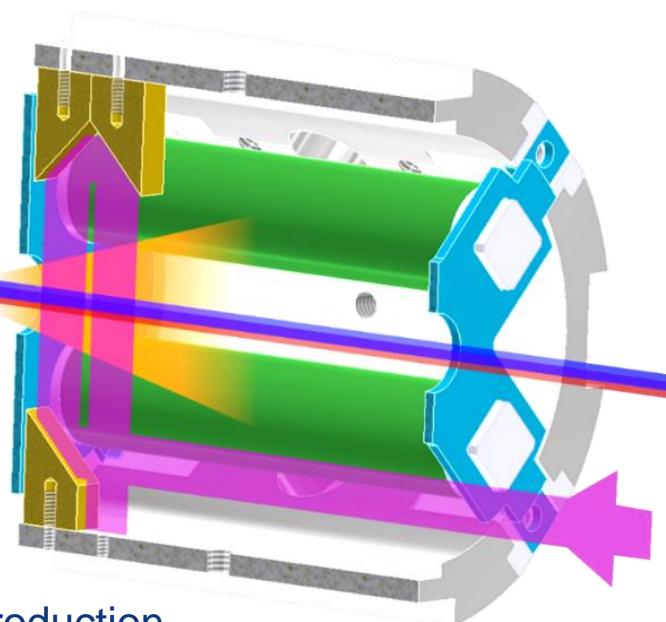

Ongoing developments

Square wave RF confinement by MHz switching:

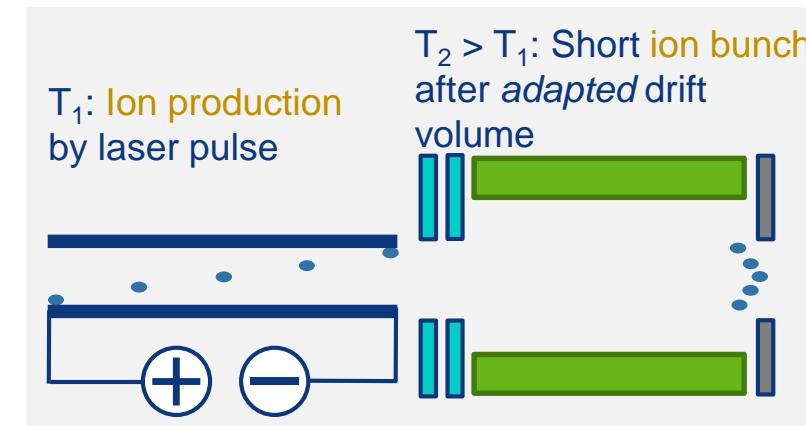

- suppression of RF box attached to target unit
- simplified control of symmetricity, amplitude, offset
- Supply to source via multipin connector

Perpendicular laser irradiation:
Doppler-free spectroscopy and RIB production

ToF-LIS: Field-free drift volume (= LIST)

In-situ heating current switching:
Fast polarity swapping and pulsing
