This talk: Simulation and Digitisation

- In the **simulation** step, we simulate the interaction of the produced particles with the detector material primarily using Geant4
- In the **digitisation** step, we emulate the response of the detector electronics to the simulated particles
- These two steps are only used when producing Monte Carlo
 - With LHC data, we apply the reconstruction to the output of the detector
- This talk does not cover **event generation**: emulation of the production of particle in high-energy collisions
 - Might also be a very interesting case to consider

The HL-LHC Computing Problem

Large discrepancy between budget and resource needs

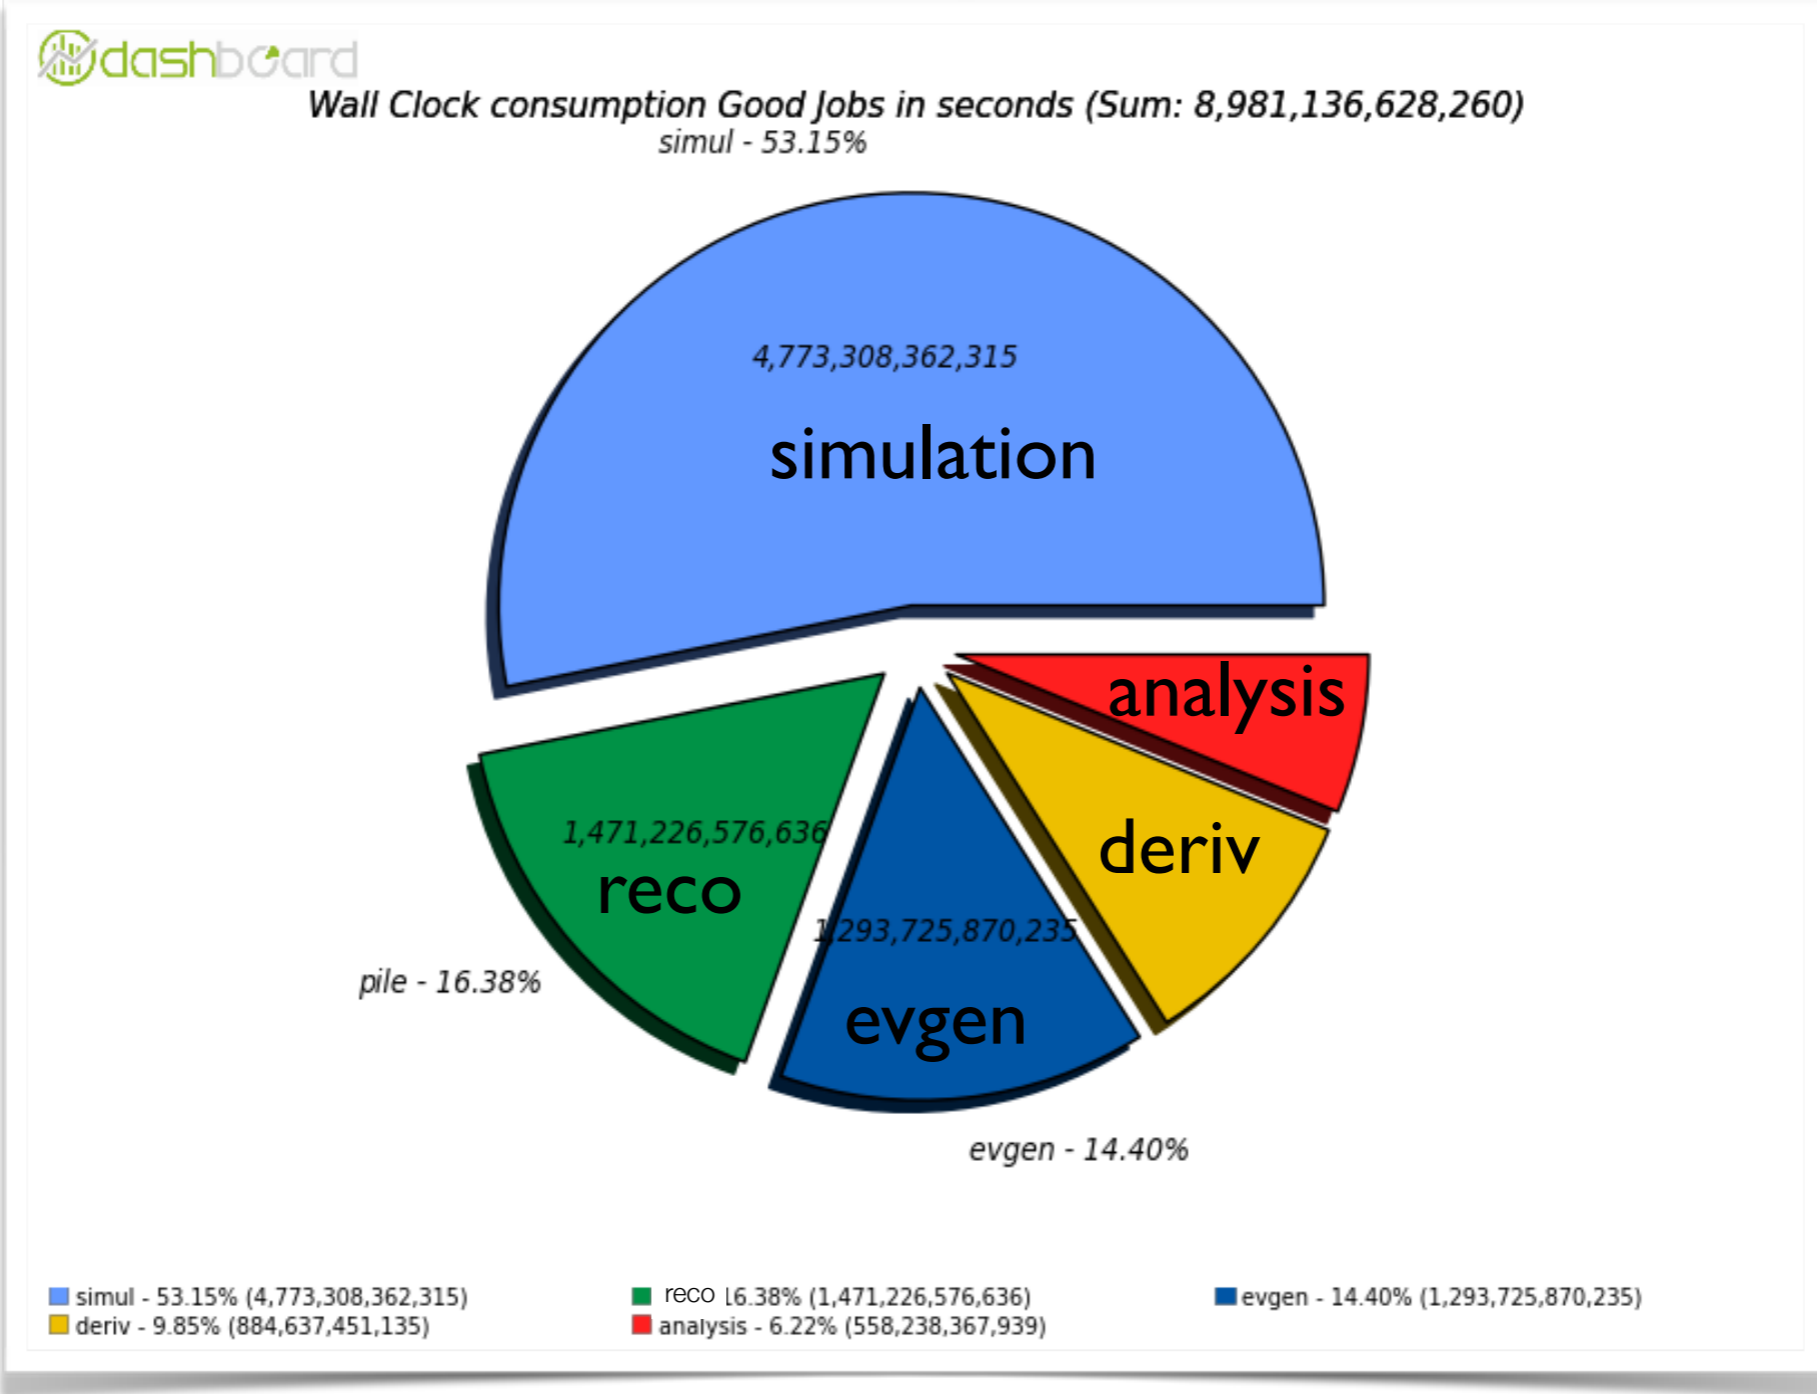

Particular issue for simulation

Source of uncertainty	σ_μ	
Total	0.259	
Statistical	0.161	
Systematic	0.203	
Experimental uncertainties		
Jets	0.035	
E_T^{miss}	0.014	
Leptons	0.009	
b-tagging	b-jets	0.061
	c-jets	0.042
	light jets	0.009
	extrapolation	0.008
Pile-up	0.007	
Luminosity	0.023	
Theoretical and modelling uncertainties		
Signal	0.094	
Floating normalisations	0.035	
Z + jets	0.055	
W + jets	0.060	
$t\bar{t}$	0.050	
Single top quark	0.028	
Diboson	0.054	
Multijet	0.005	
MC statistical	0.070	

Already now, with 80 fb-l of data (3% of the projected total), many key analyses have MC statistics as a key systematic uncertainty

How ATLAS uses CPU

Largest fraction (53%) of CPU time is used for **simulation**

July 2017 - July 2018

Simulation by detector

ATLAS

Subdetector CPU fraction for 50 ttbar events
MC16 Candidate Release

Most of the time (64%) is spent in the EM calorimeters
Followed by the Inner Detector

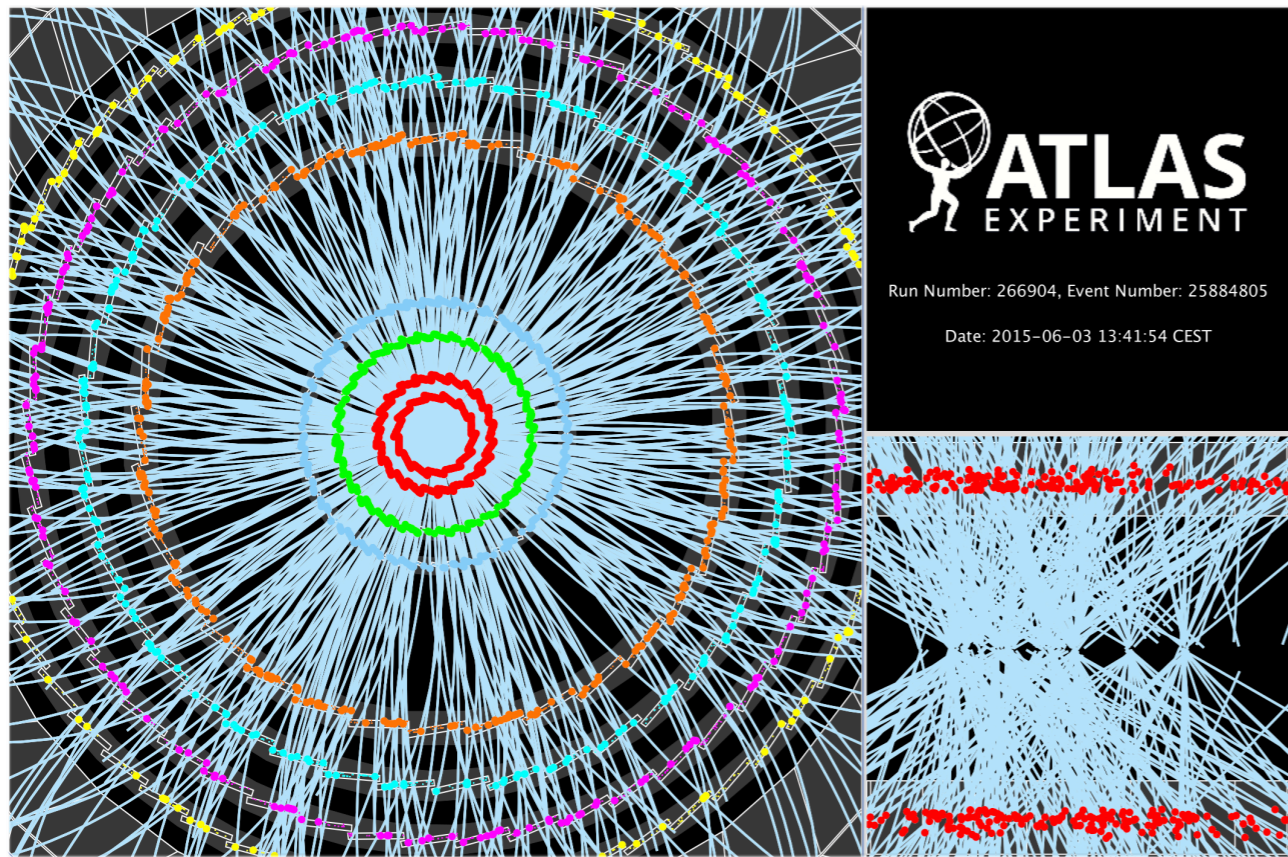

ATLAS Calorimeters

See talk by W. Lampl for more details

Main reason is the complex accordion structure of the calorimeters

Additional Challenge: Pile up

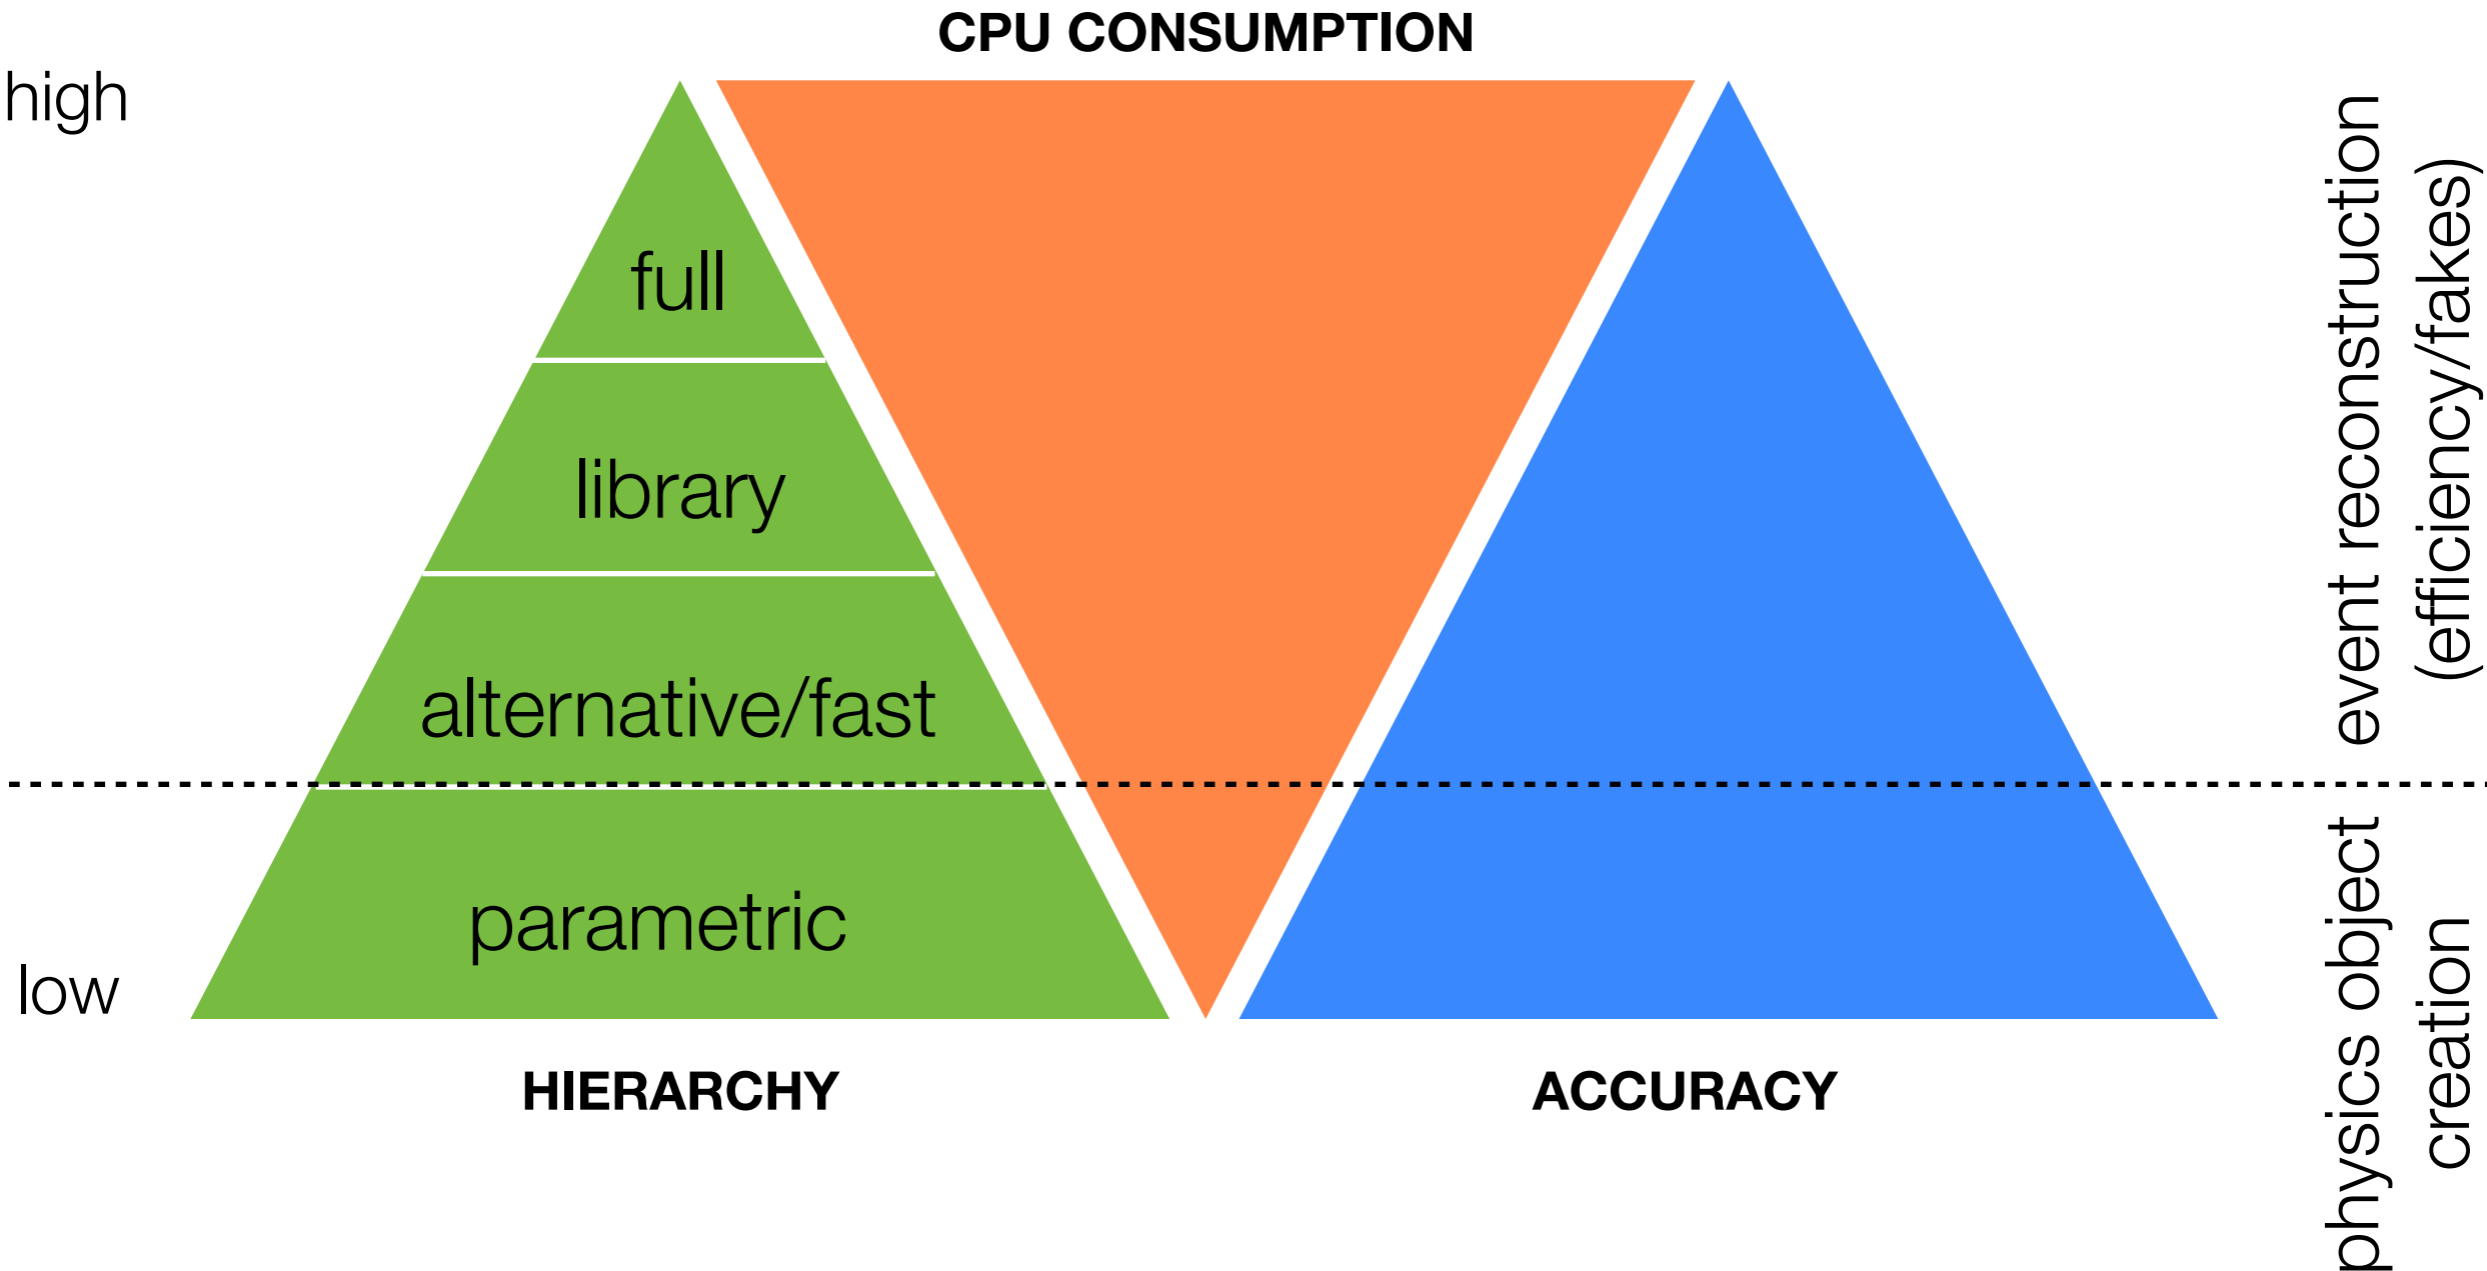

Event display of a typical LHC event

Typically need to simulate ~ 40 additional proton-proton interactions per collision
Want to save time by reusing pile up events, but this introduces significant complications to the chain

Simulation Flavours

ATLAS Simulation Tools

FastCaloSim

Parametrised calorimeter response

Fatras

Fast inner detector simulation

FastDigi

Fast inner detector digitisation

Pseudotracking

Truth information to skip pattern recognition

The Idea: Integrated Simulation Framework

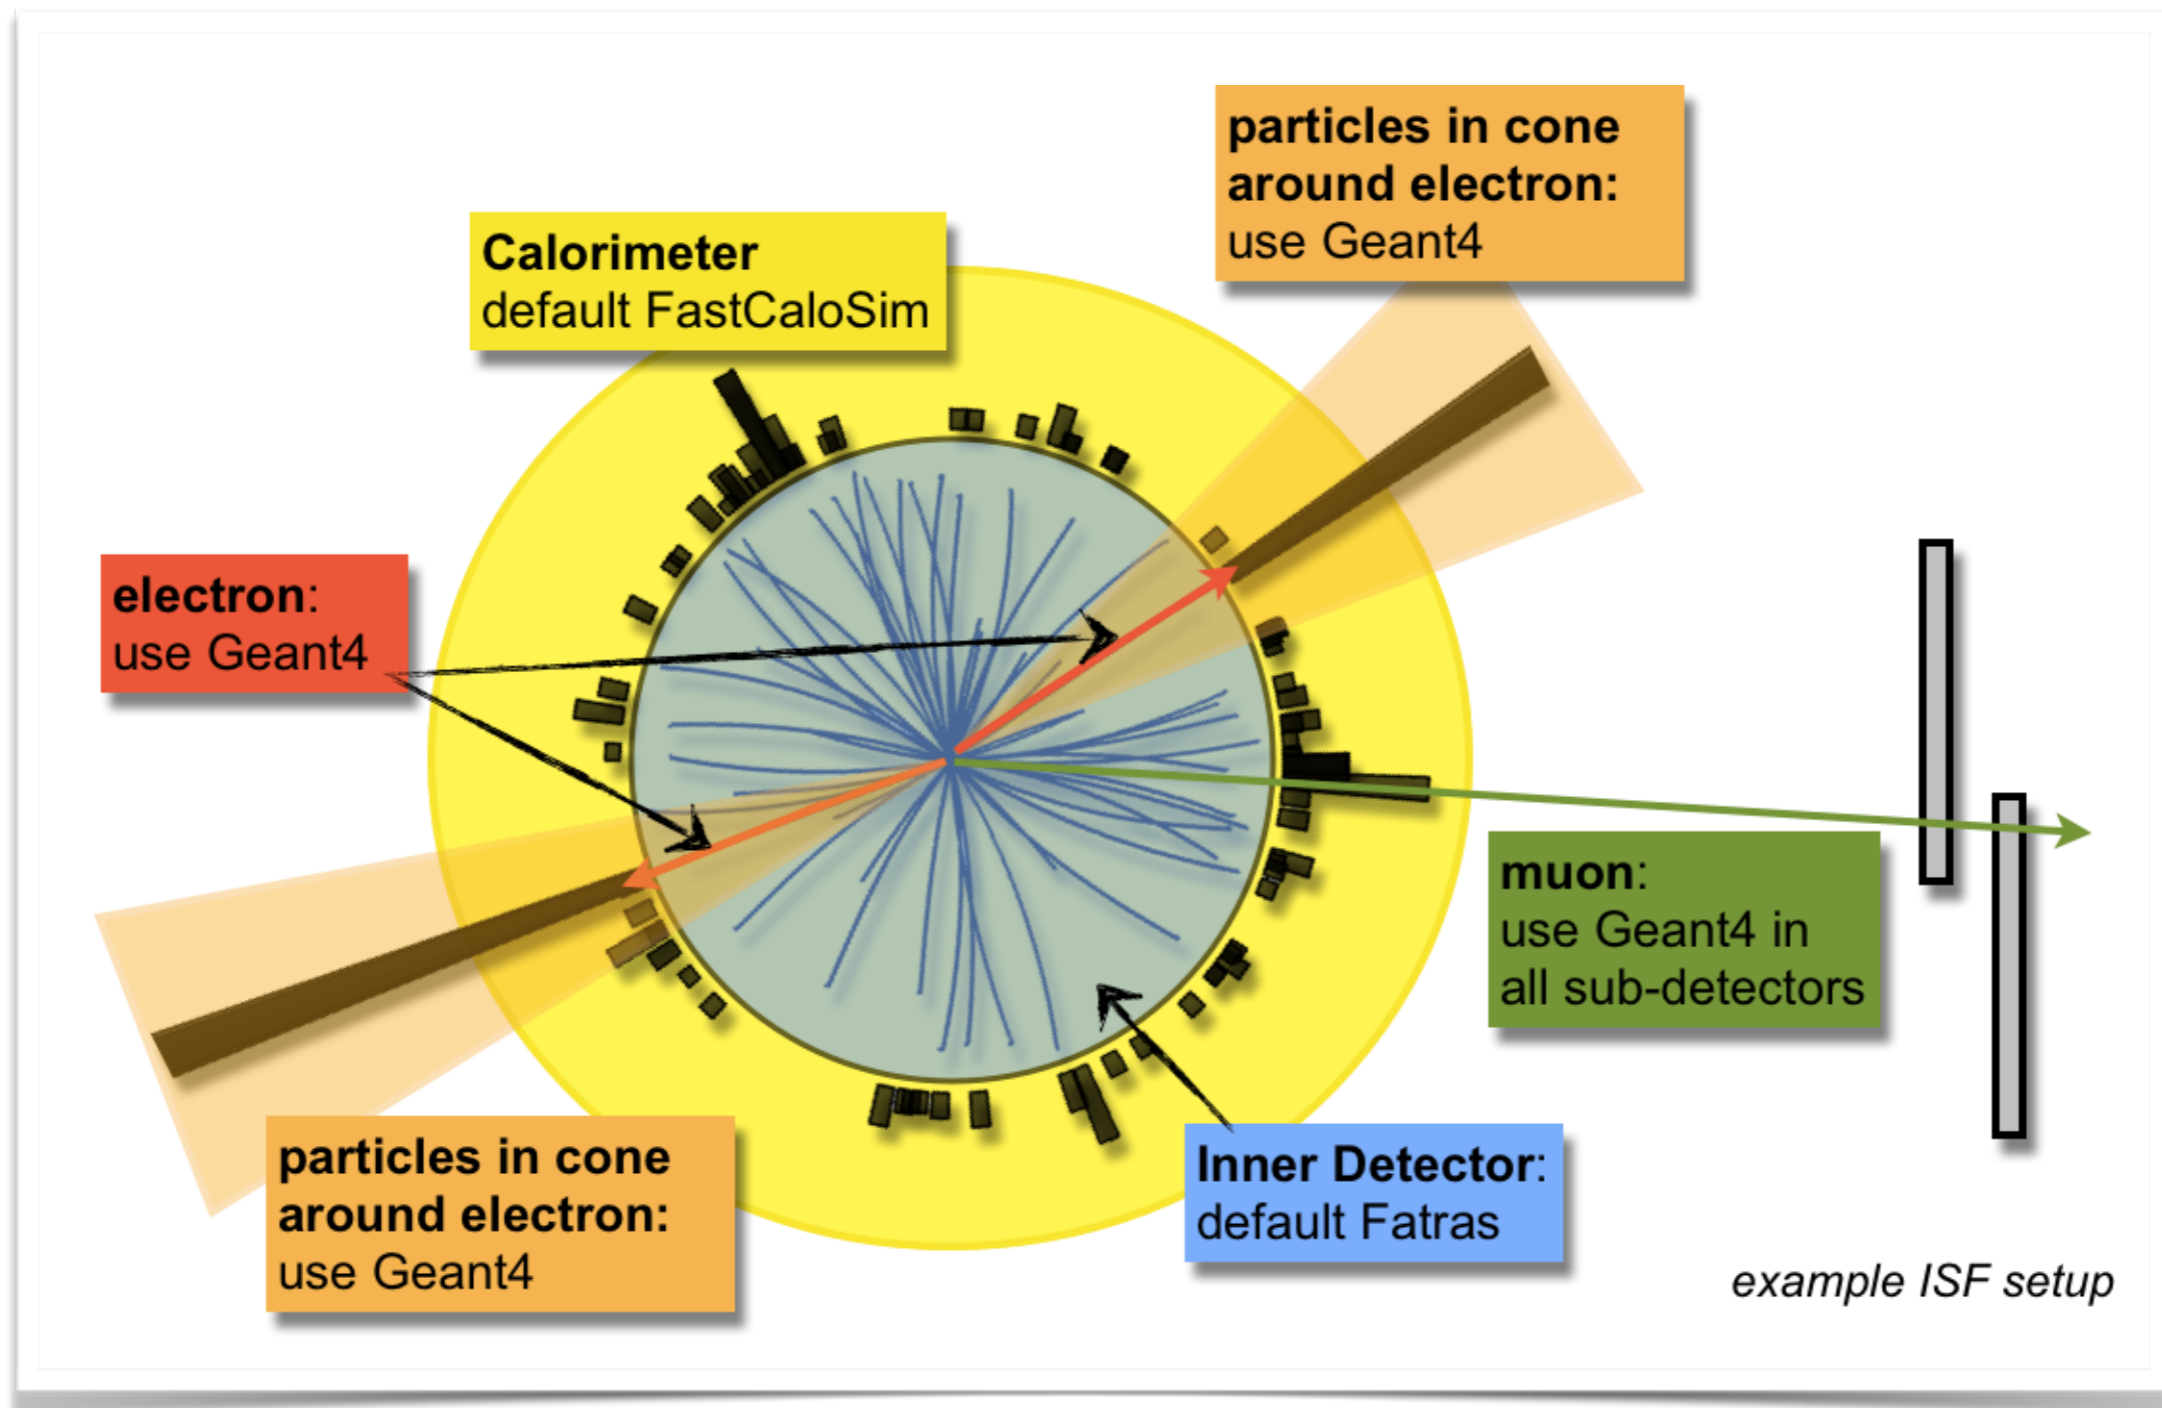

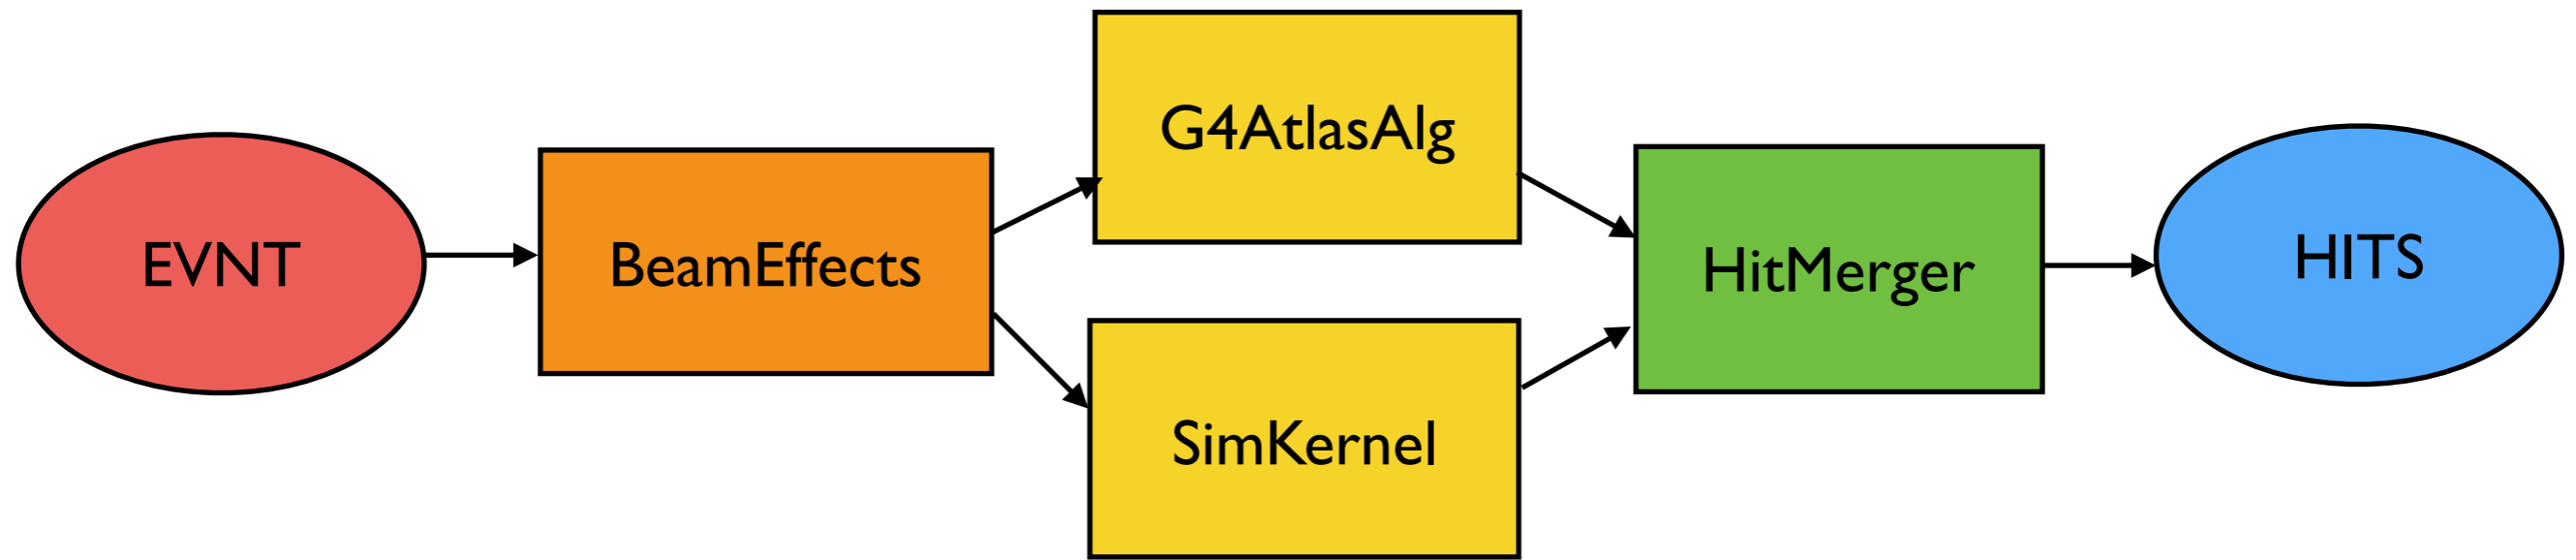

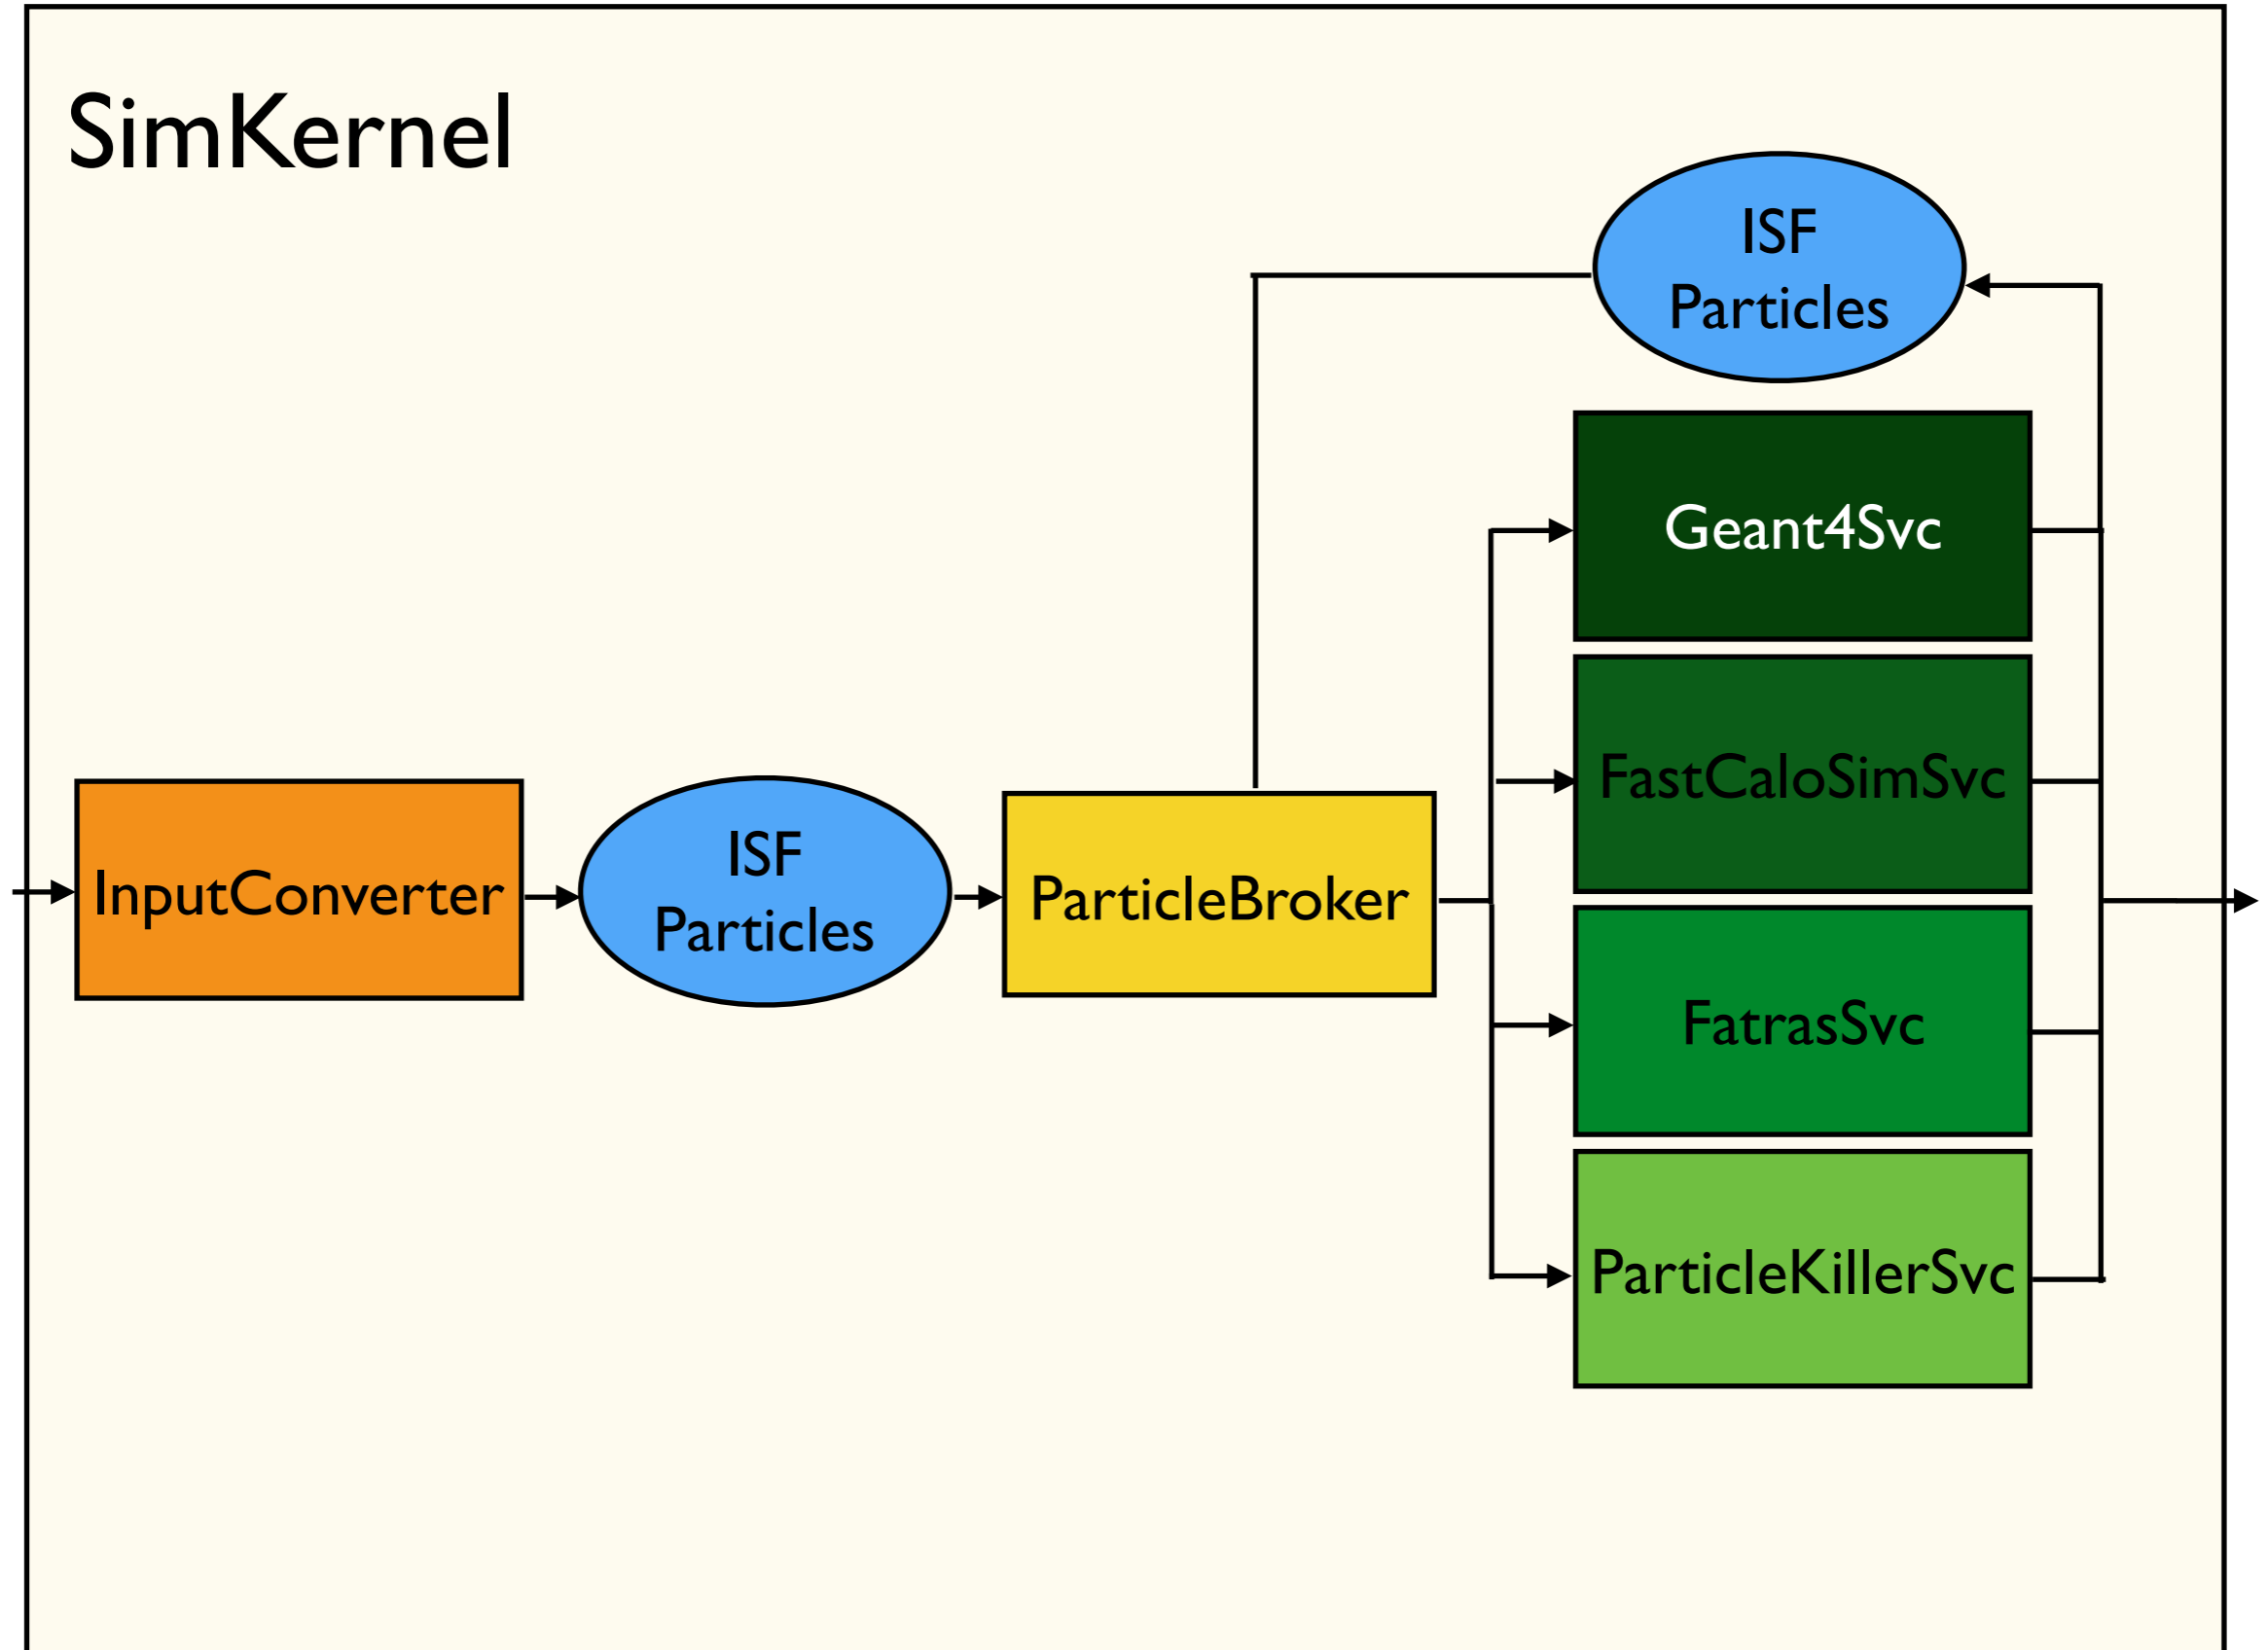

Image credit: A. Salzburger

We have the capabilities to produce events like this, but in reality we use the ISF to use different simulation flavours in different detectors

Simulation Overview

Simulation: SimKernel

Geant4Svc

- The simulation is done in the external Geant4 package, but we have an interface to configure the following
 - Geometry
 - Sensitive detectors
 - Magnetic field
 - Physics list
 - Additional processes
 - User actions
 - Fast simulation models (e.g. frozen showers)
- Comments
 - G4 can already run multithreaded (but only in our upcoming release)
 - ISF needs to be migrated to MT
 - In the longer term, should think about how much we want to maintain ISF vs rely on G4 to handle fast simulation models

Geant 4 [Download](#) | [User Forum](#) | [Gallery](#) | [Contact Us](#)

Search Geant4

Geant4 is a toolkit for the simulation of the passage of particles through matter. Its areas of application include high energy, nuclear and accelerator physics, as well as studies in medical and space science. The three main reference papers for Geant4 are: *Nuclear Instruments and Methods in Physics Research A* **506** (2003) 250-303, *IEEE Transactions on Nuclear Science* **53** No. 1 (2006) 270-278, *Nuclear Instruments and Methods in Physics Research A* **835** (2016) 186-225.

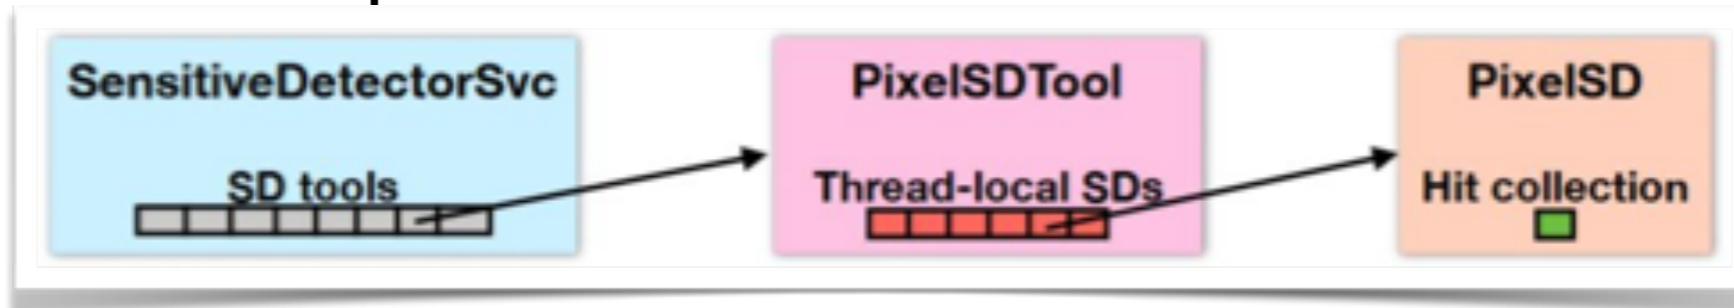

Applications **User Support** **Publications** **Collaboration**

News

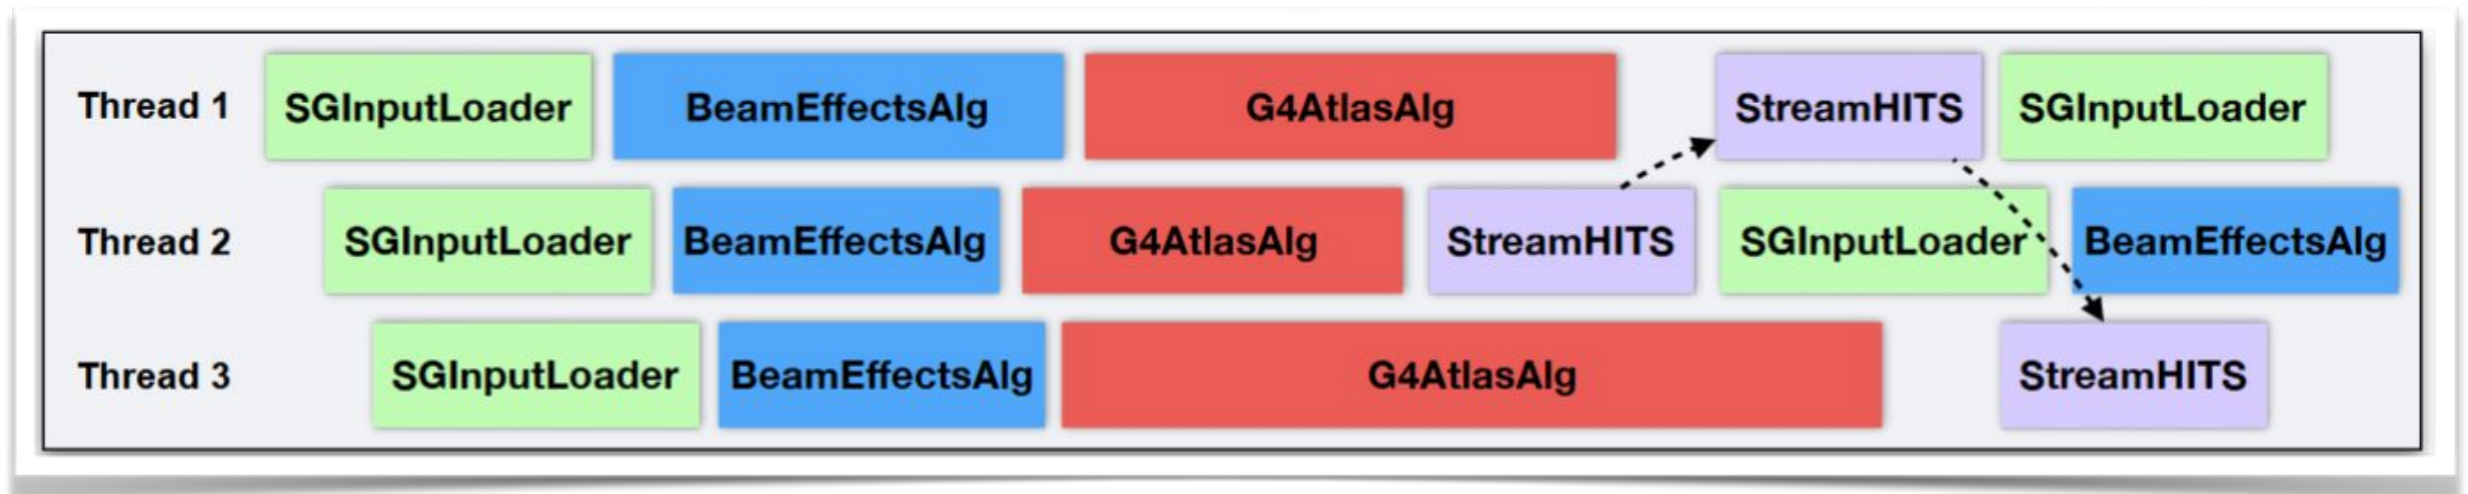

- 8 December 2017 - **Release 10.4** is available from the [Download](#) area.
- 20 October 2017 - **Patch-03** to release 10.3 is available from the [source archive](#) area.
- 8 March 2017 - [2017 planned developments](#).
- 27 January 2017 - **Patch-03** to release 10.2 is available from the [source archive](#) area.

Geant4MT in AthenaMT

- Composite model of Gaudi/Athena components that create + manage thread-local G4 components

- Thread-local workspaces setup via new thread initialisation tool framework mechanism
- Processing algorithms are clone to execute on different events concurrently
- One instance of the output stream algorithms (StreamHITS) services all worker threads: Being replaced by SharedWriter to handle multiple parallel threads

Speeding up the Full Simulation

Improvements already in place

Configuration	MinBias	ttbar
Nominal production configuration: shower libraries in the forward calorimeter, nominal range cuts, NystromRK4 stepper, FTFP_BERT_ATL physics list, 250ns neutron time cut, simulation of primary particles with pseudo-rapidity below 6.0	1.0	1.0
No shower libraries	1.5	1.3
ClassicalRK4 stepper instead of NystromRK4	1.09	1.07
No neutron time cut	1.02	1.01

Detector simulation white paper: [arxiv:1803.04165](https://arxiv.org/abs/1803.04165)

Further Improvements

- Optimizations
 - Improved G4Solid implementations. (4%)
 - Optimize choice of G4Solids used to create given volumes.
 - **Big Library (static-linking) (10%)**
 - **Profile-guided optimization (5%?)**
- Simplifications
 - Geometry simplification
 - Hadronic cross-section tables
 - **More aggressive G4 cuts**
 - **Russian roulette for neutrons**

Fast Simulation

- **FastCaloSim**

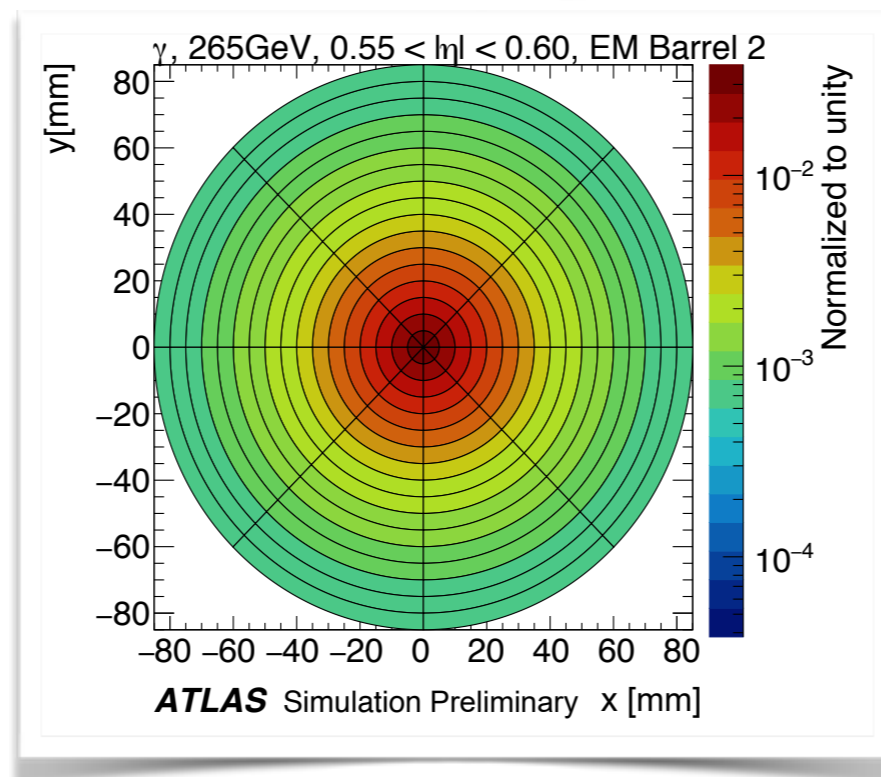

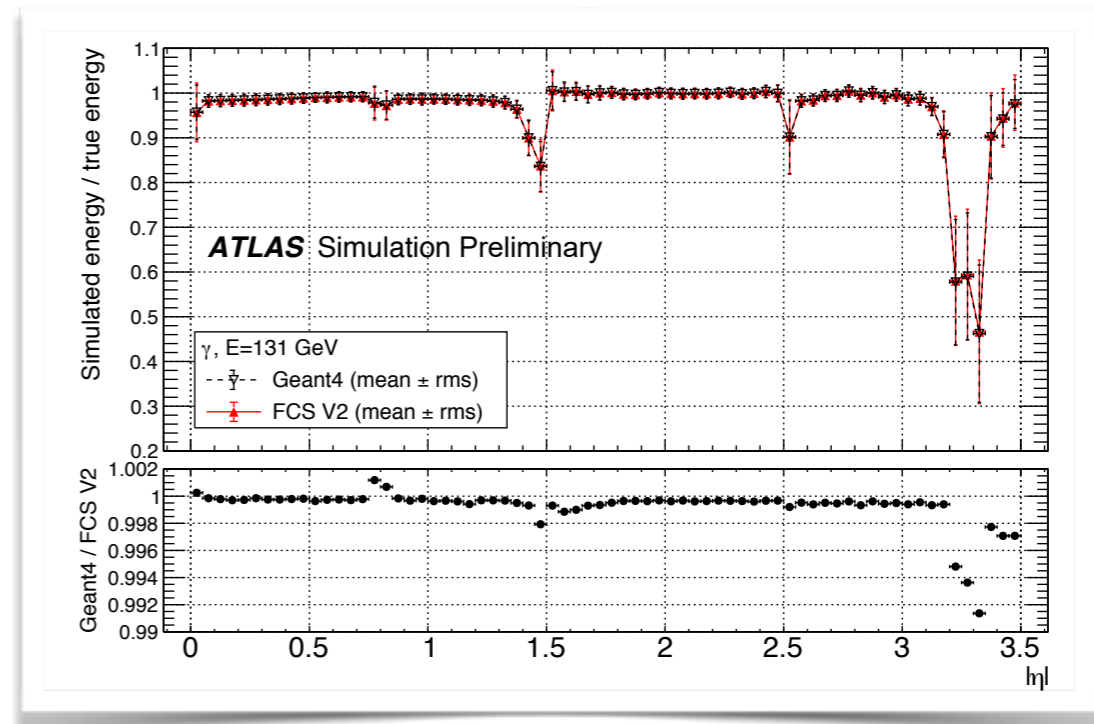

- Updated version is under development to provide improved physics performance (similar speed is expected)
- Framework updates required so that it is not thread hostile
- Quite a bit of work will be required to make it thread-safe

- **Fatras**

- Little manpower for maintenance
- Significant work required to make it thread-safe
- G4 used for hadronic interactions
 - Could consider making the interaction with G4 closer for the future?

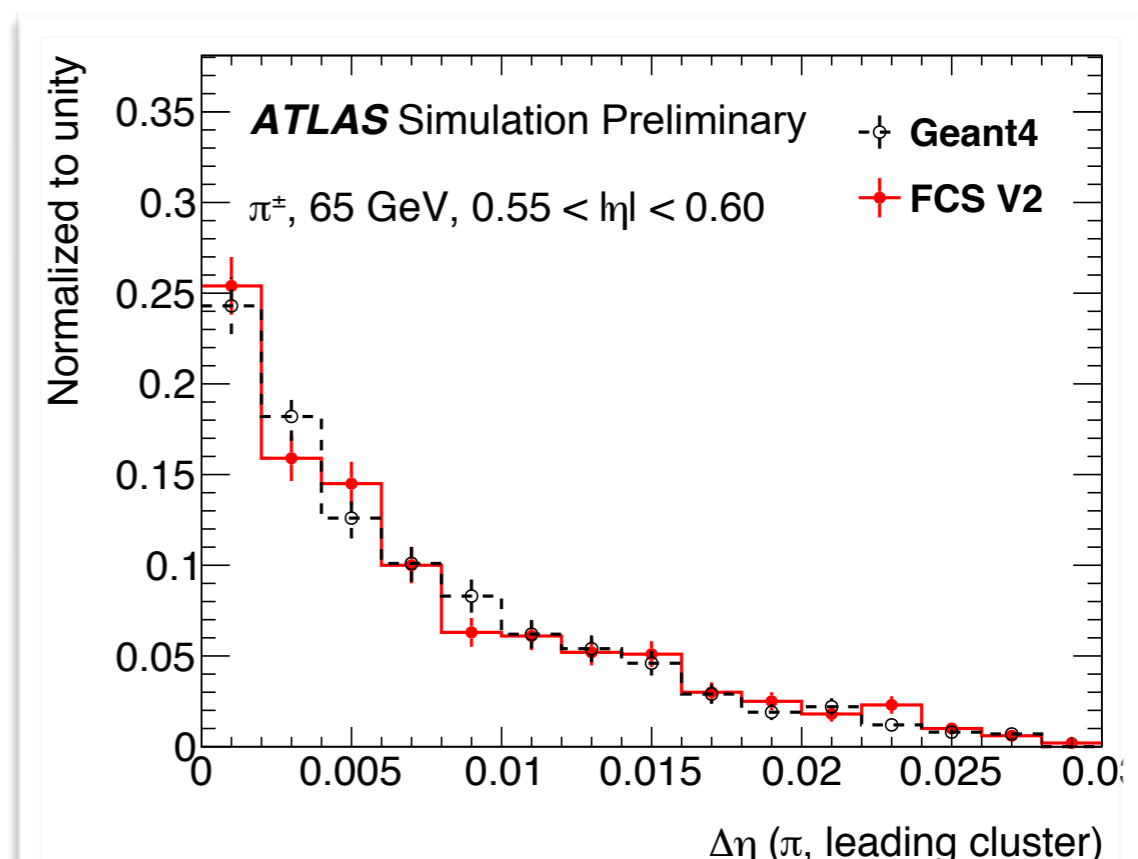

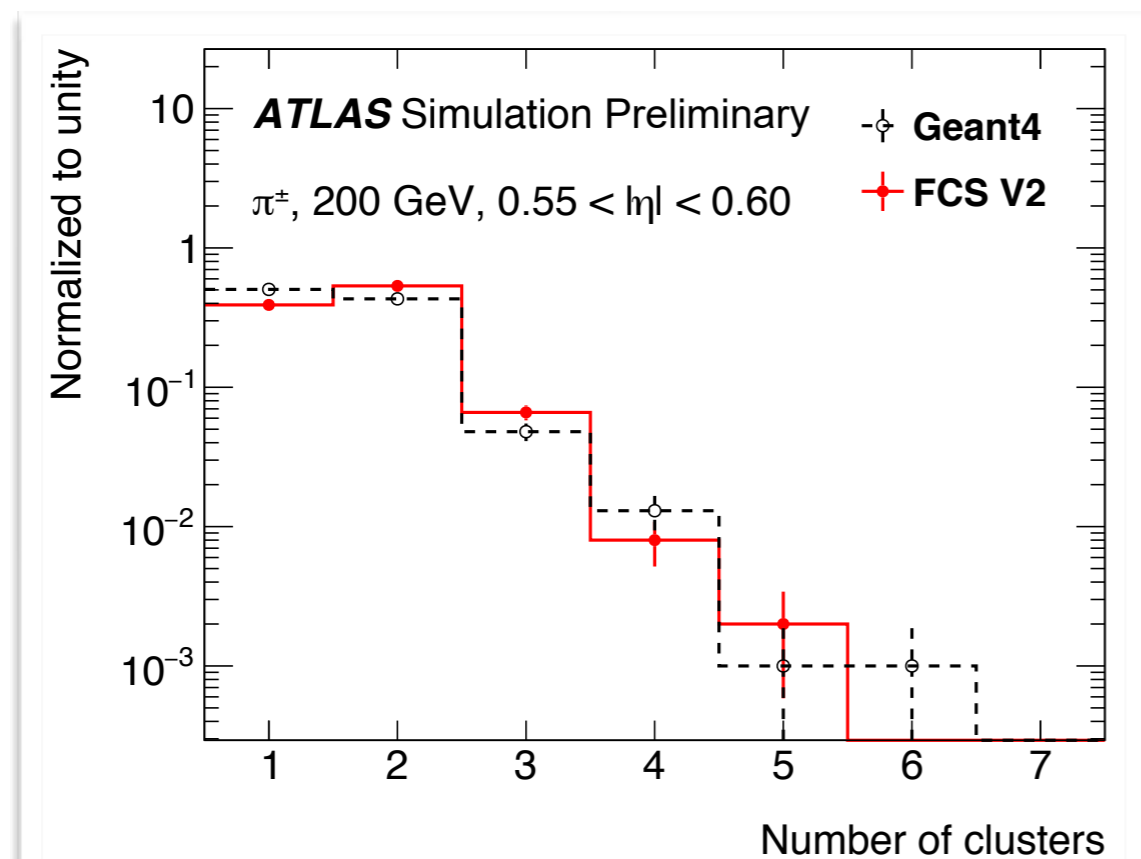

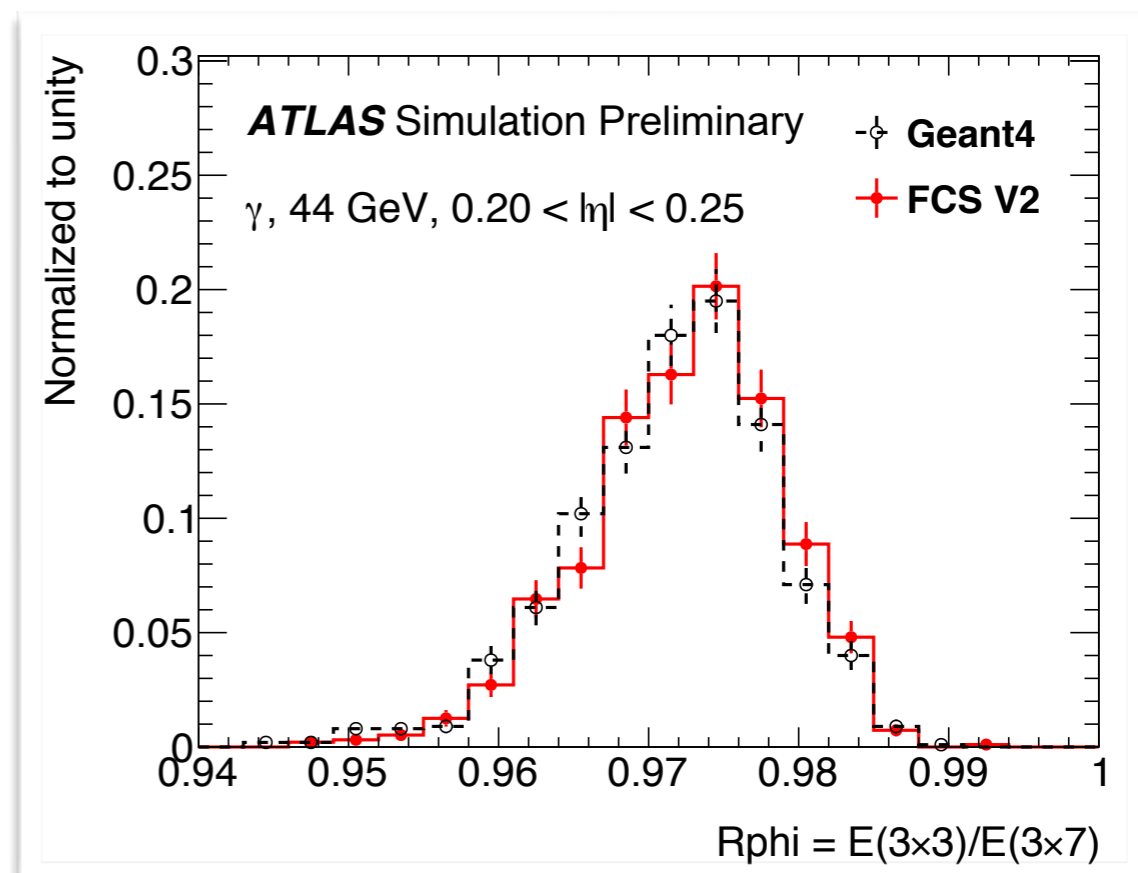

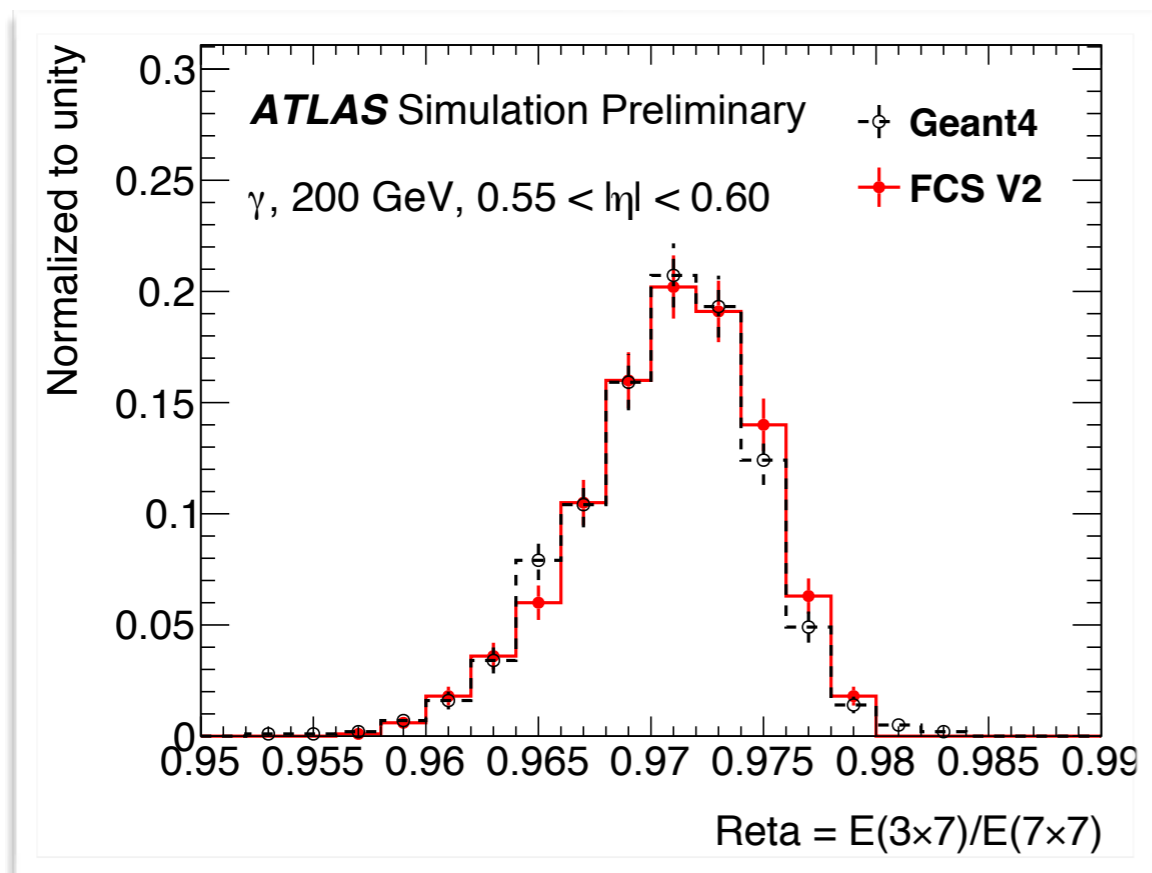

FastCaloSim

- Parametrise the energy and shower shape for single particles in the calorimeters as a function of energy and direction (η)

More details

Performance of FastCaloSim

Dramatic CPU savings

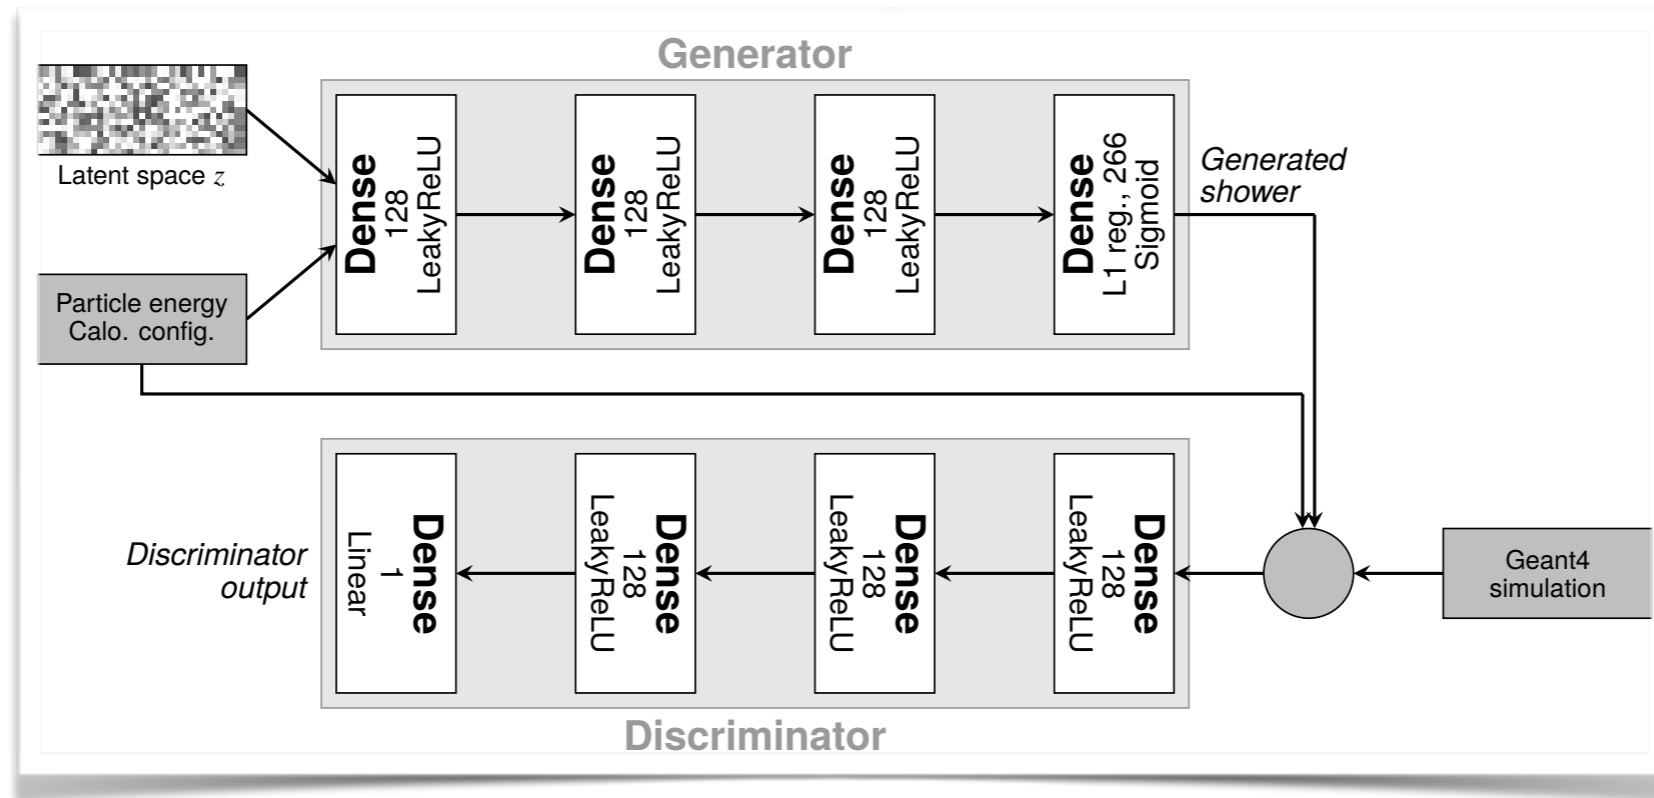

Simulation from the inner calorimeter surface only

Challenges for FastCaloSim

- Producing and managing the large number of events required to derive the parametrisation
 - $O(150M)$
- Accurately modelling the correlations in the energy between the different layers
 - Use a PCA approach to decorrelate
- Modelling the shower fluctuations
 - Exploring approaches based on ML
- Parametrising the calorimeter response accurately and efficiently
 - A simple histogram-based solution would require 8 GB of memory ...

R&D: Ideas from Machine Learning

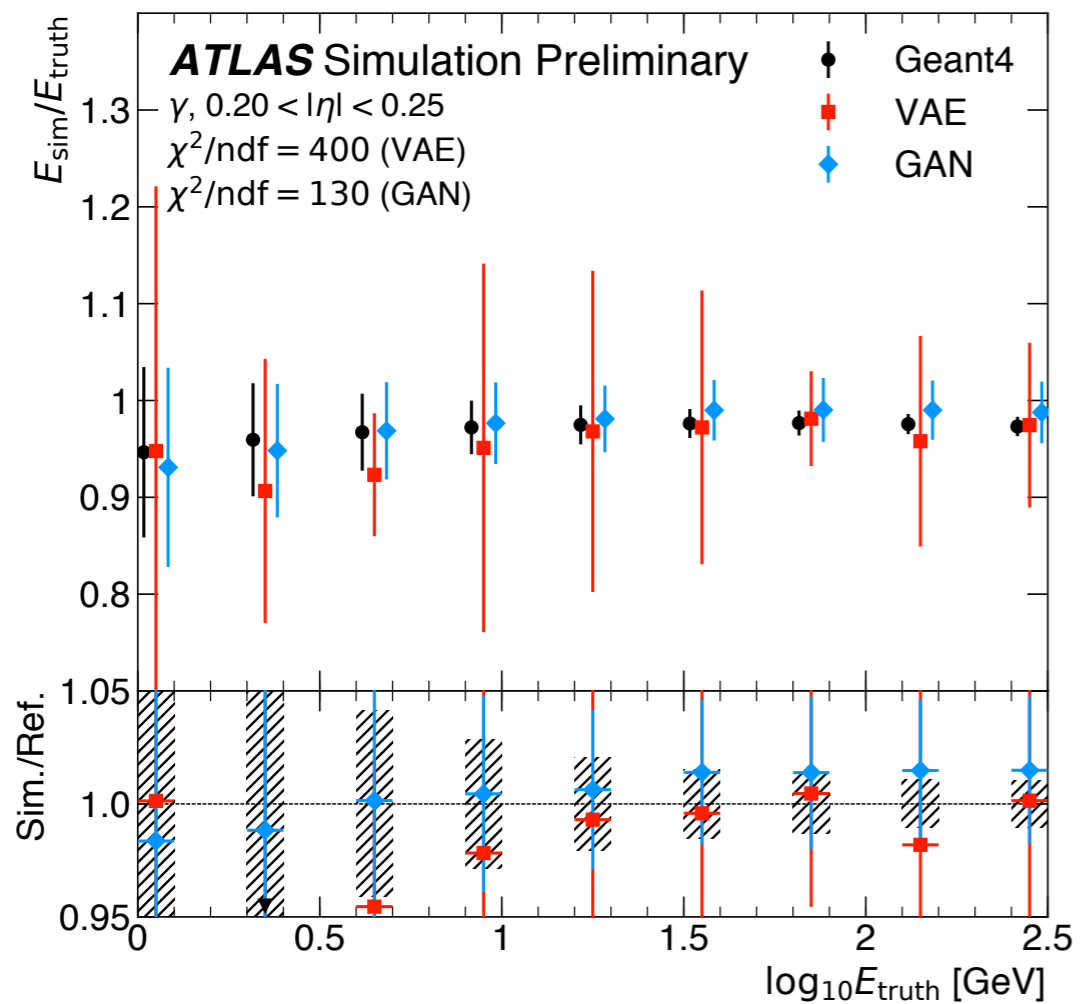

GAN

VAE

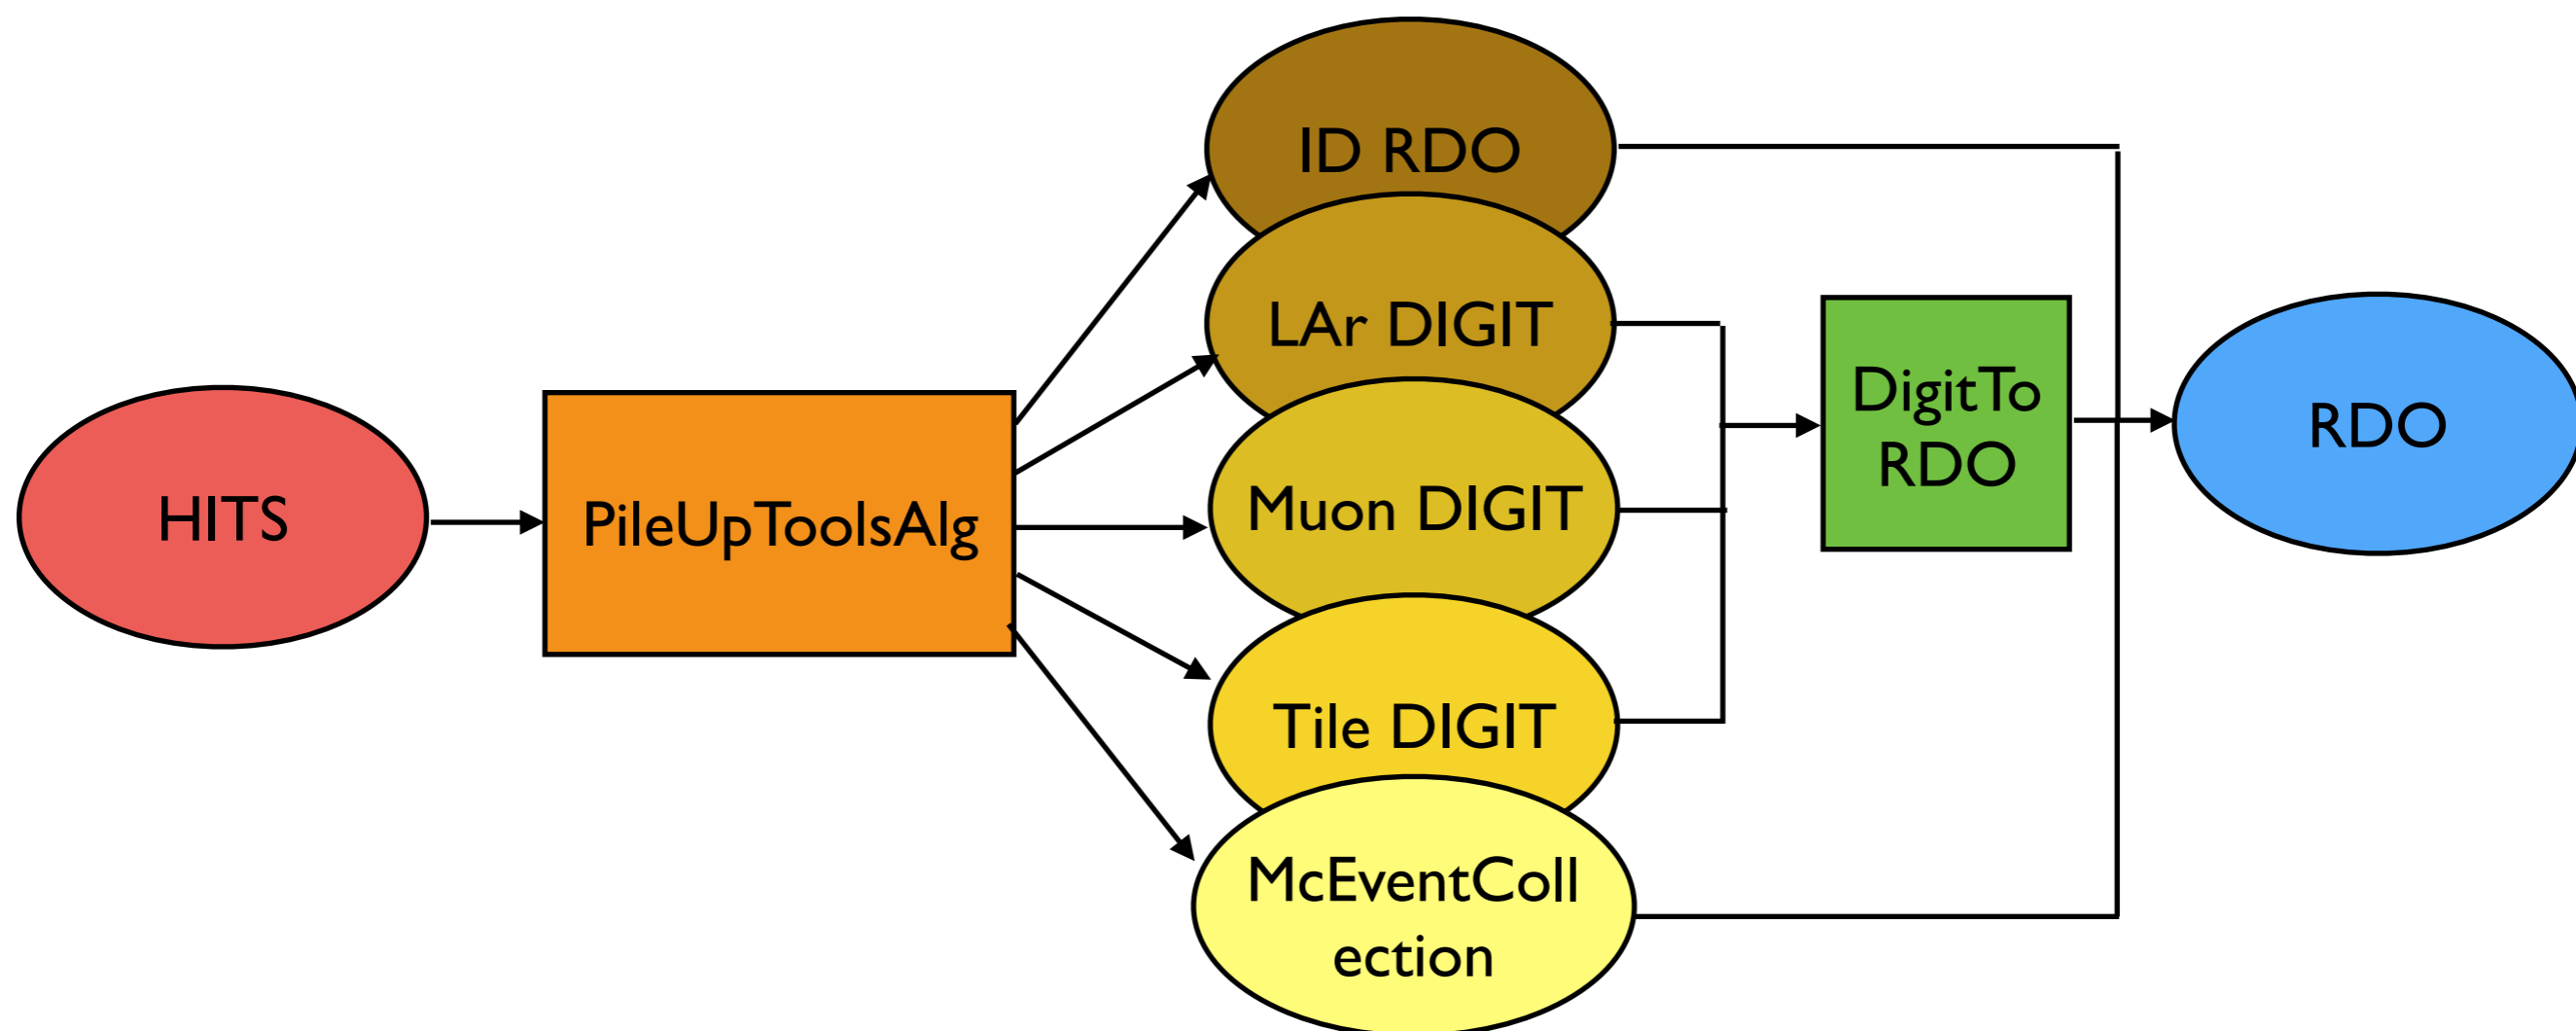

Early Results

More results

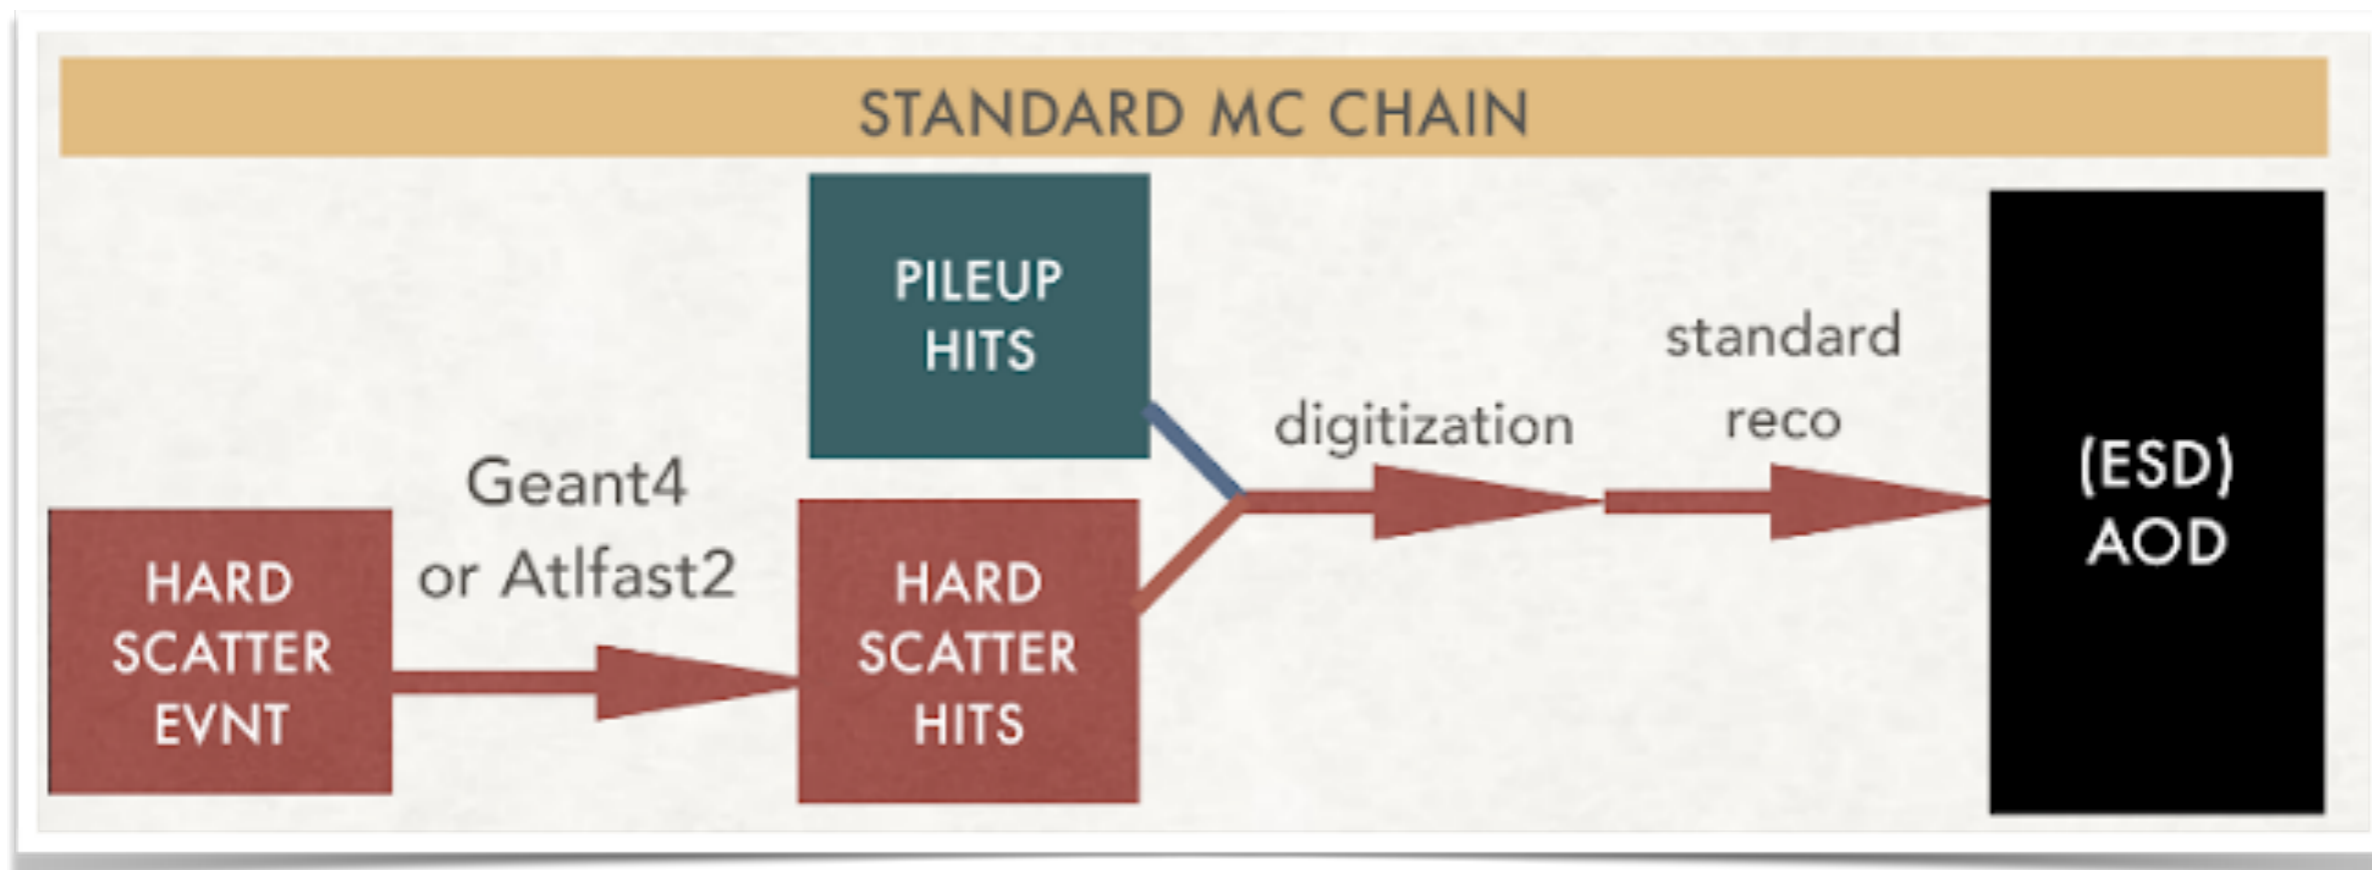

Digitisation Overview

Hard scatter only

DIGITs also contain additional trigger information

Producing events with pile up

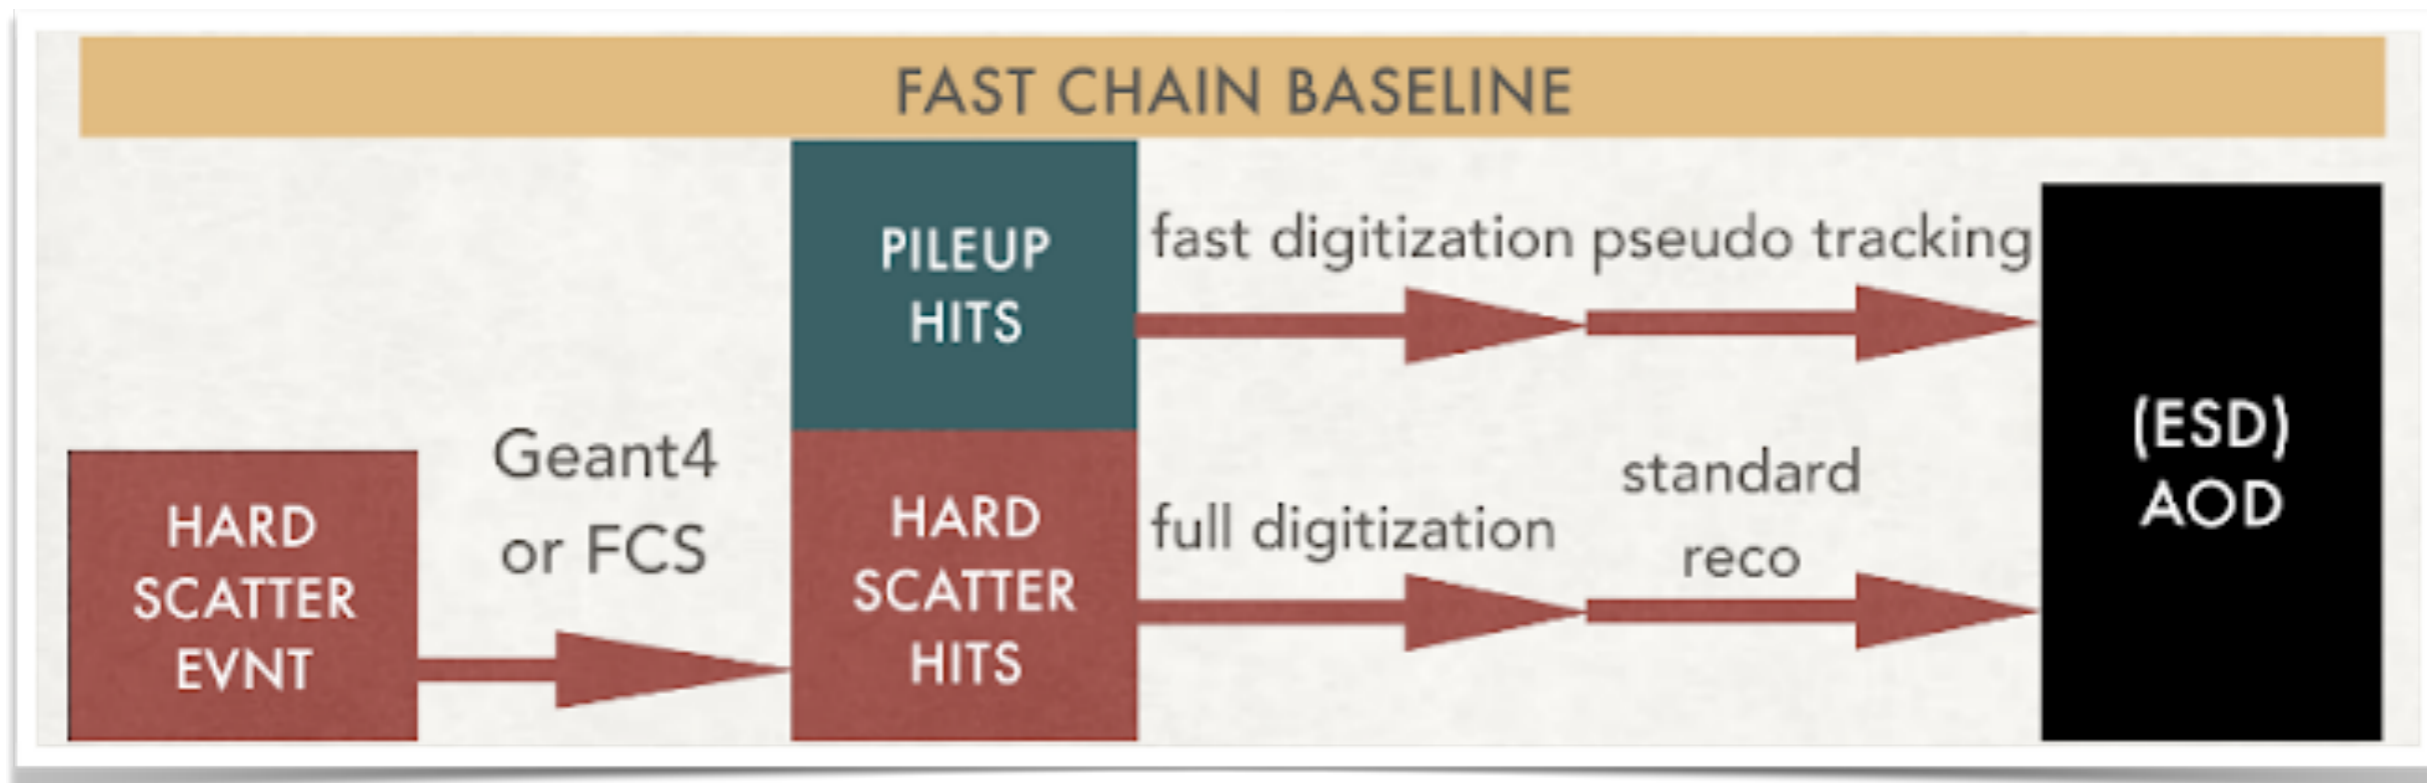

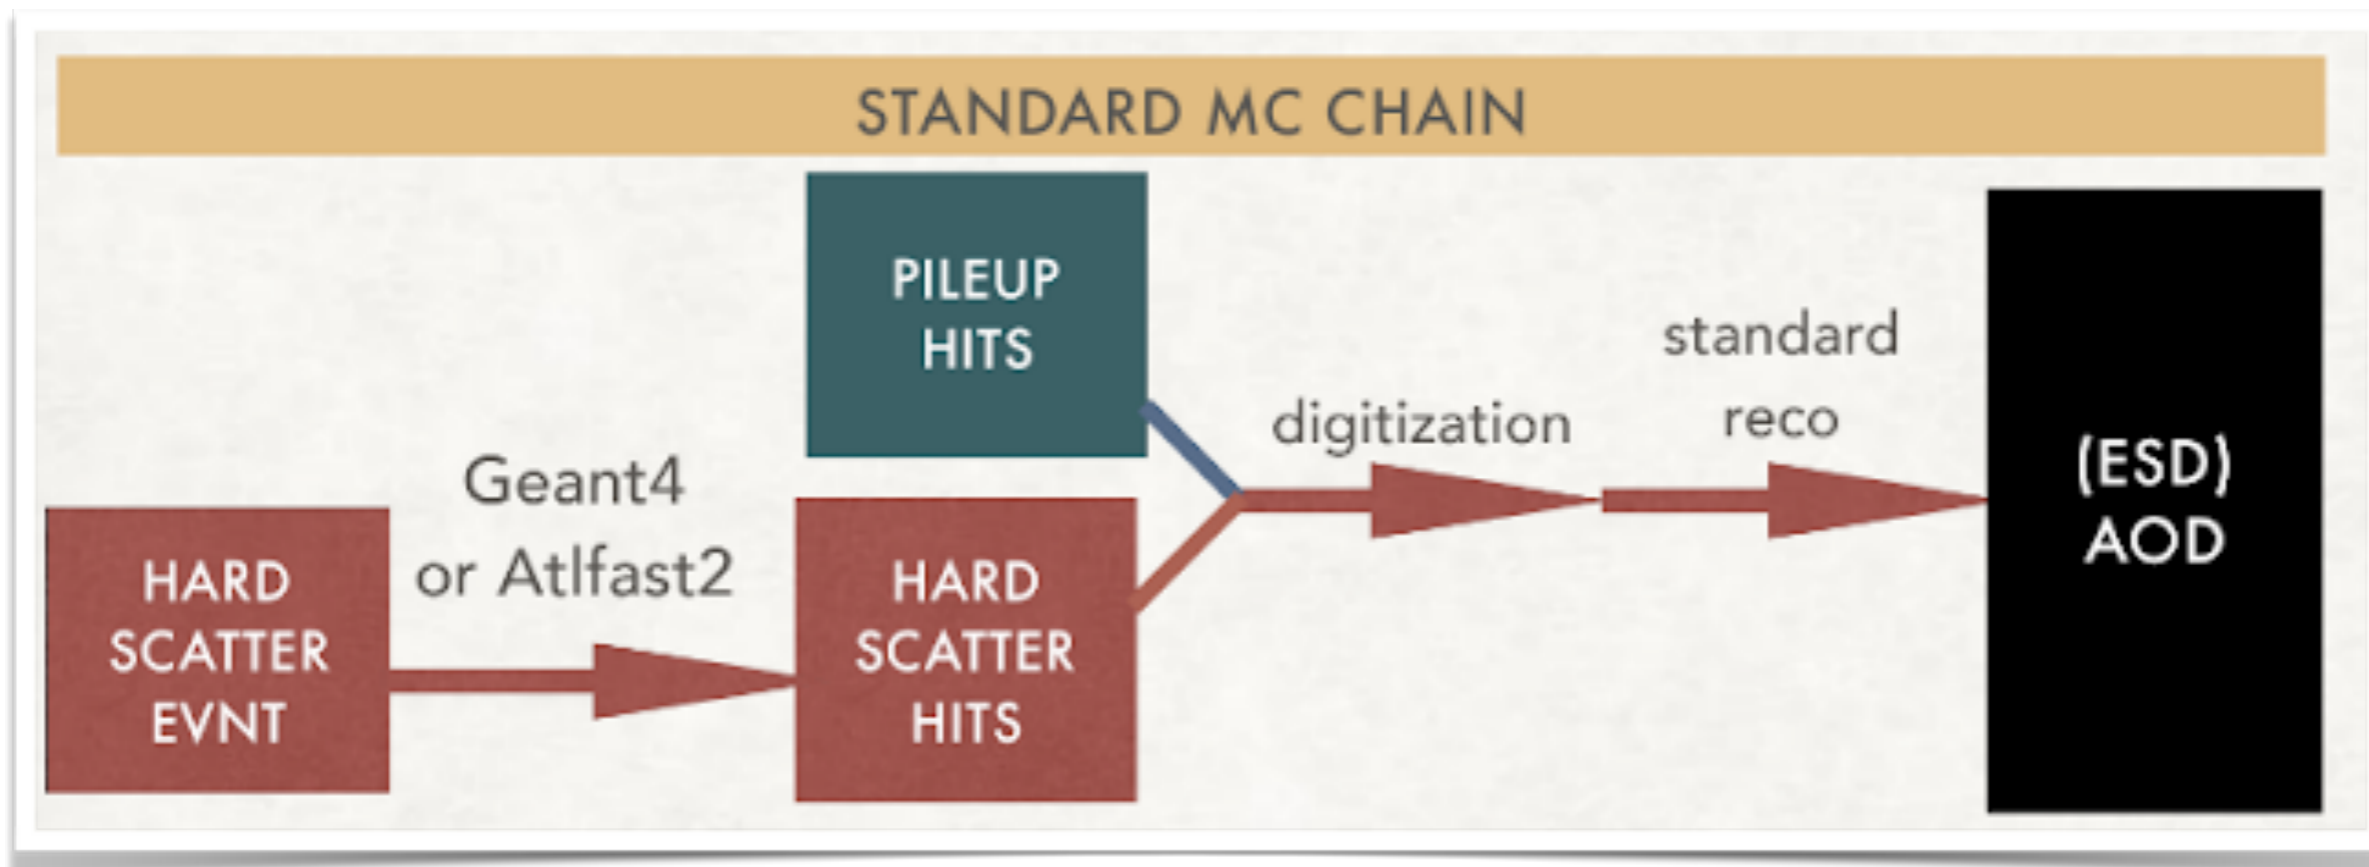

Digitisation (with pile up)

- PileUpEventLoopMgr replaces the AthenaEventLoopMgr
- BkgStreamsCache (1 per pile up type: low pT minbias, high pT minbias, etc)
 - Array of EventSelectors ($O(4000)$)
 - For each bunch-crossing (39 in total):
 - Get $\langle \mu \rangle$ by sampling from a Poisson random distribution to obtain the actual $\mu = N$
 - Pick N background events from the caches
 - Create a new `xAOD::EventInfo` object with references to all required `StoreGates` with a record of which BCID each is used for
- PileUpToolsAlg
 - For each bunch crossing
 - Queries each PileUpTools: are you interested ?
 - If yes, pass list of `StoreGates` to look at and process
 - Clear used events after all PileUpTools have been queried (memory)

Comments on MT Digitisation

- Can already run single hard scatter events with MT
- Challenge is in the treatment of the pile up
 - Need to minimise memory
 - Also ensure that events aren't used too many times
- Potential Strategy
 - Share pool of background events between threads
 - Events need some sort of state
 - Have they been used?
 - Are they currently in use?
 - Discard once used sufficient times
- This would require significant core athena development as these concepts don't exist in Gaudi

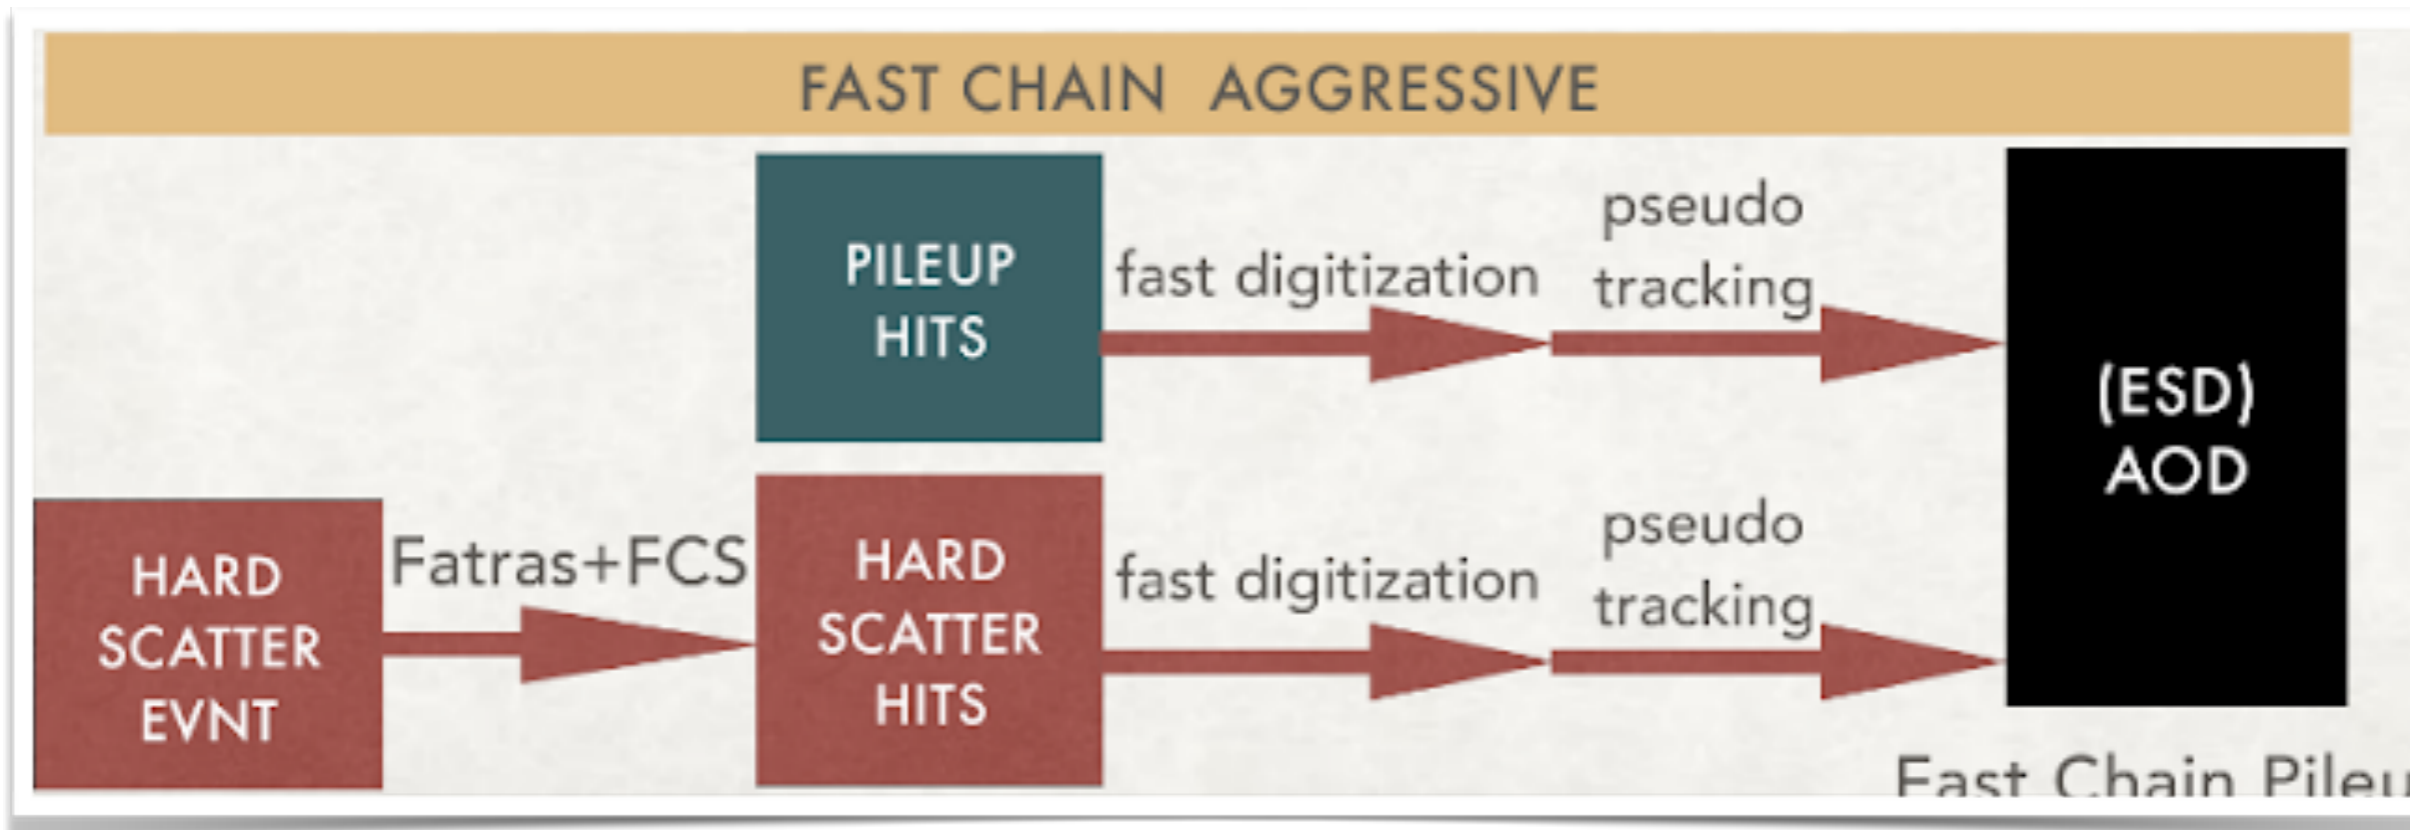

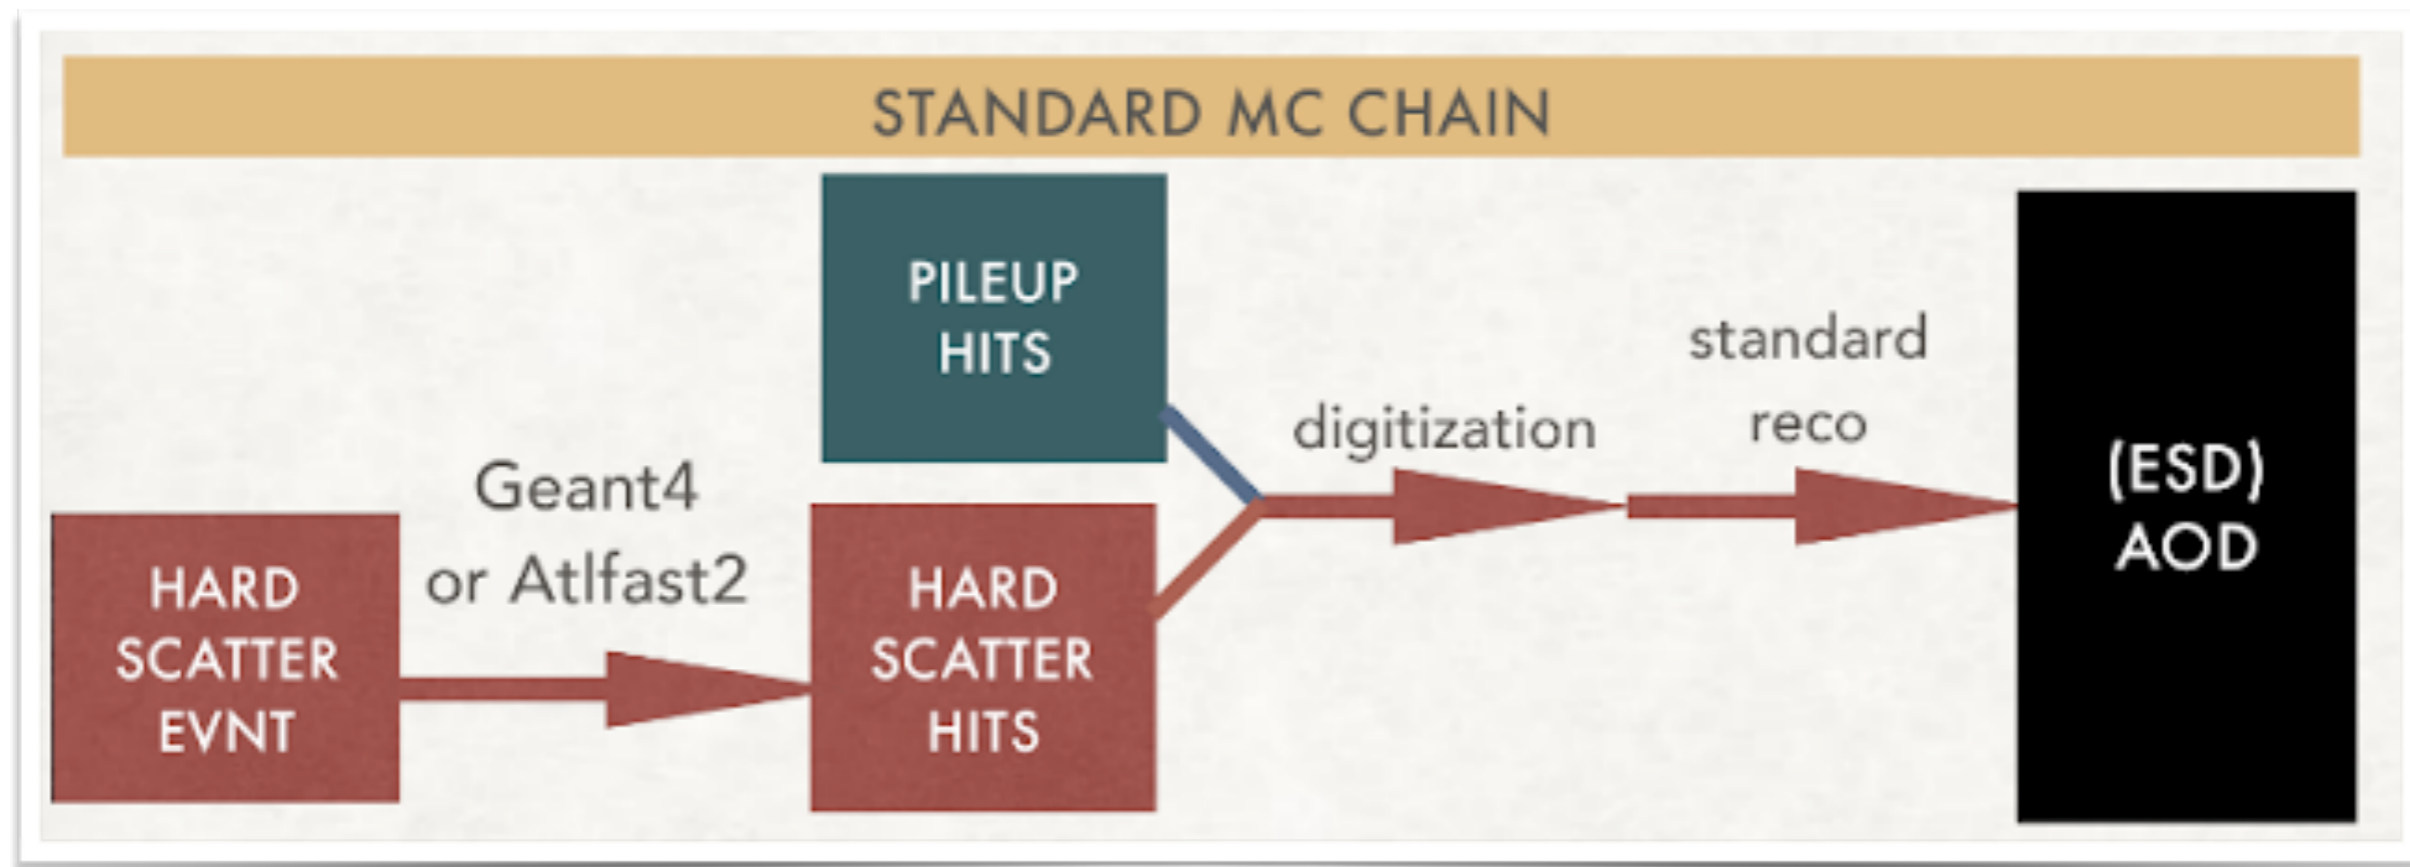

FastChain: Baseline

$O(300)\times$ faster

Image credit: T. Lari

FastChain: Aggressive

$O(300)x$ faster

Image credit: T. Lari

Conclusion

- Detector simulation is the main driver of CPU in the production of simulated datasets for the ATLAS experiment
 - In the future, with larger datasets and more pile-up the problem will become even more challenging
- Presented a brief overview of simulation (both full and fast) and digitisation in the context of the ATLAS experiment
- Highlighted aspects of our current practises, work in progress and ideas for future directions
- Comments and feedback are very welcome !
