

Emittance Evolution Update

C. Rogers, ISIS Intense Beams Group
Rutherford Appleton Laboratory

Emittance Evolution

- Referee's meeting on Wed 26th September
 - Reviewed the MICE Note
 - Summarise the meeting and major actions/reactions
- MICE Note describes:
 - Selection of data
 - Validation of detector reconstruction and model
 - Validation of cooling channel and model
 - Amplitude calculation
 - Estimation and correction of systematic effects
 - Uncertainties

Selection of Data

C. Rogers, ISIS Intense Beams Group
Rutherford Appleton Laboratory

Upstream Selection Criteria

- Upstream Selection Criteria are:
 - One space point in TOF1 and TOF0
 - One track in TKU
 - $\text{TKU } \chi^2/\text{dof} < 4$
 - TKU fiducial volume cut
 - TOF01 cut
 - $135 < \text{Momentum in TKU} < 145 \text{ MeV}/c$
 - Successful extrapolation to TOF0
 - Diffuser aperture cut $< 100 \text{ mm}$

Downstream Selection Criteria

- Downstream Selection Criteria are:
 - In upstream sample
 - One TKD track
 - TKD $\chi^2/\text{dof} < 4$
 - TKD fiducial volume
 - TKD momentum
- Overall:-
 - Between about 3 % and 10 % of events make it into the upstream sample
 - Between about 65 % and 90 % of upstream sample events make it into the downstream sample
 - MC sample is somewhat limited; need to rerun a “final” MC with higher stats

Actions

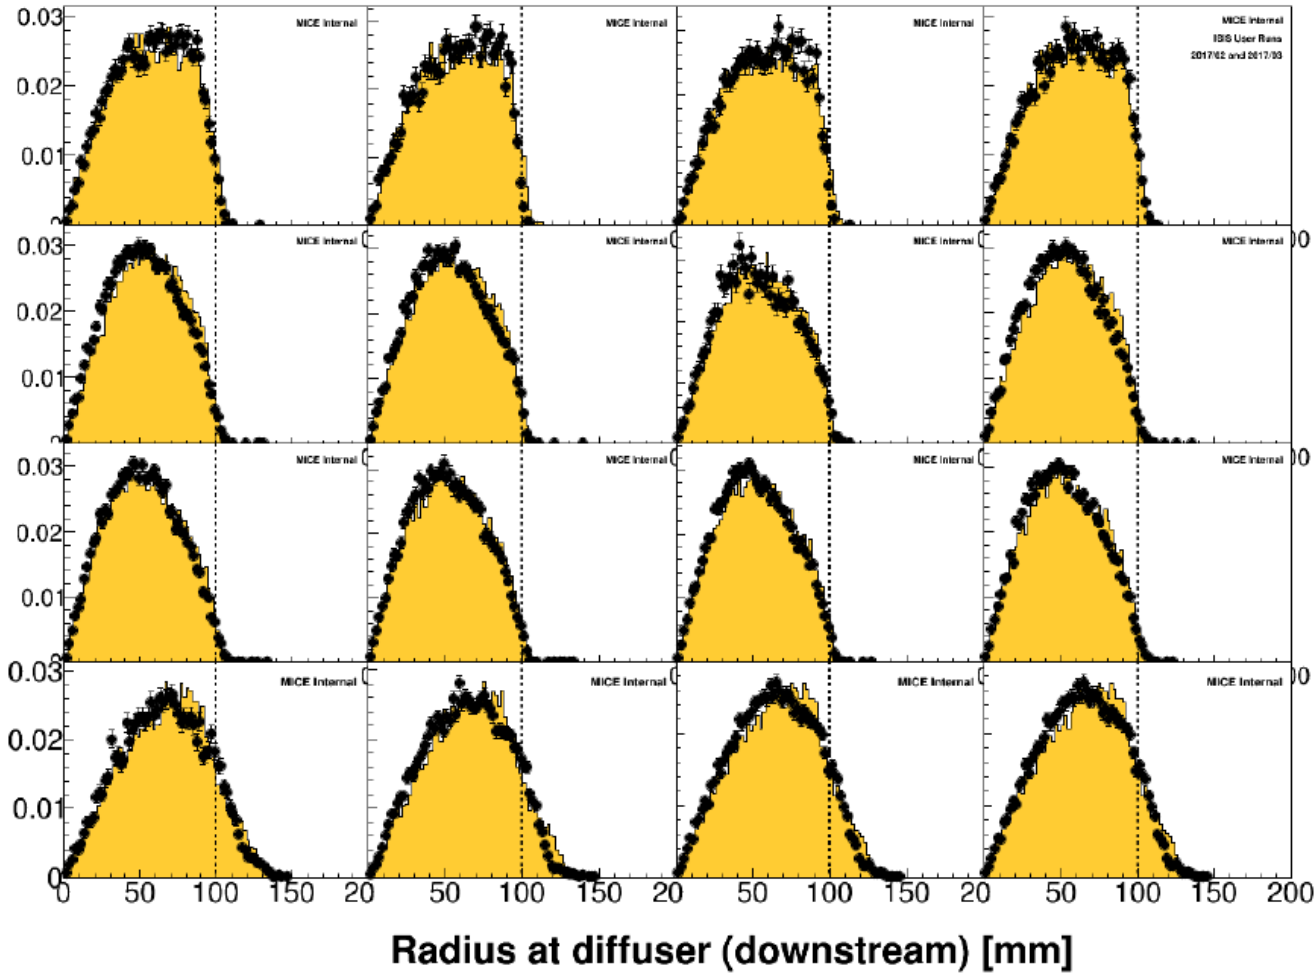

- Improve agreement between diffuser MC and simulation
- Understand excess in TOF2 space point events in MC
- Change diffuser aperture cut from 100 mm to 90 mm
- Chase tracker glue density measurement (for chi2 tuning)
- Tune momentum distribution better
- Remove requirement that we successfully extrapolate to TOF0
- Concern over level of disagreement between TOF01 MC vs data

Detector Performance

C. Rogers, ISIS Intense Beams Group
Rutherford Appleton Laboratory

Detector Comparison

- Tracker reconstruction:
 - Cluster-finding efficiency is not well reproduced in MC, especially in TKD (which is where it counts!)
 - Concern about tracker efficiency particularly at low pt
 - Incorporate combined TOF-tracker fit and TKU-TKD fit
 - Concern about bias in tracker residuals $O(1 \text{ MeV}/c)$
 - Rogers to chase tracker folks
- TOF reconstruction:
 - Referees propose reweighting to improve TOF data vs MC
- Comparison of detectors:
 - Some concern at level of disagreement between detectors
 - Await revised tracker recon
 - Add “banana plot”

Selection Criteria

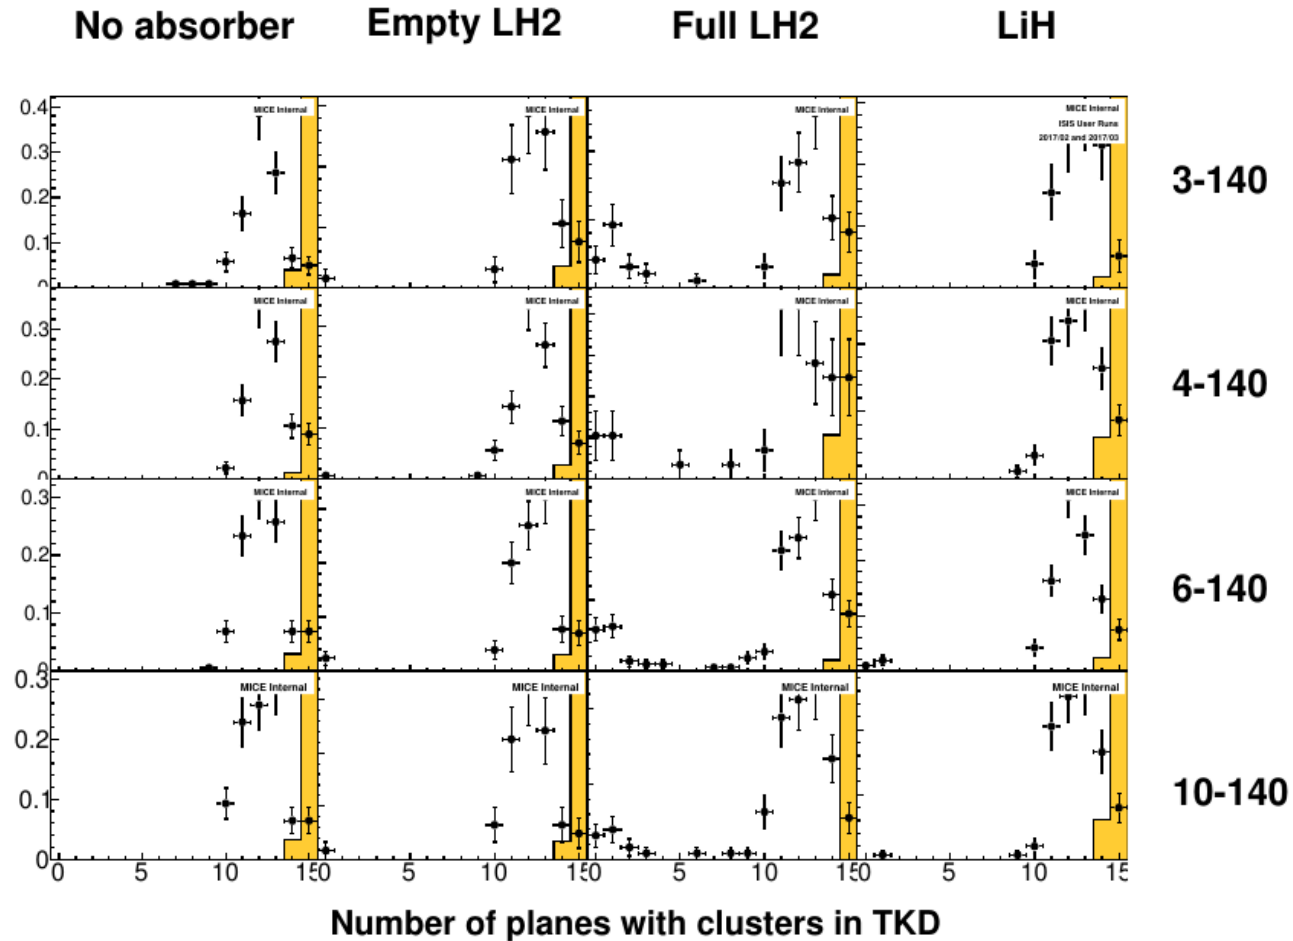

Figure 20: Number of planes in TKD that contain at least one cluster. Here we take all events in the upstream sample, and add the requirement that exactly one space point was reconstructed in ToF2 and no track was reconstructed in TKD.

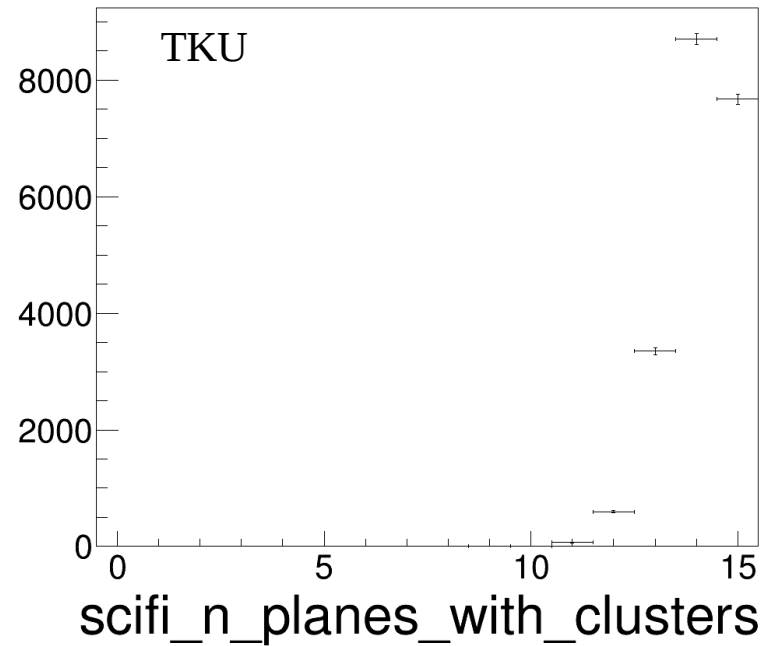

Tracker Clusters

Modified Reco (Drielsma)

Modified Reco (Drielsma)

Plan to adopt Francois's reconstruction
when it is migrated into MAUS

Cooling Channel

C. Rogers, ISIS Intense Beams Group
Rutherford Appleton Laboratory

Cooling Channel Validation

- Request MC for comparison in beam optics plots
- Request MC for comparison in energy loss vs position in absorber

Amplitude Calculation

C. Rogers, ISIS Intense Beams Group
Rutherford Appleton Laboratory

Amplitude Calculation

- Amplitude is calculated in “the usual way”
 - Note addition of tail rejection, split statistics
- Resolution correction (upstream and downstream)
- Efficiency correction (downstream)
- Uncertainties – systematic and statistical
 - Mostly benign

Conclusions

- No major problems with the paper
- Some expected requests to improve MC
 - In progress
