

Searches for long-lived particles with the CMS detector

Wednesday, 22 May 2019 15:20 (20 minutes)

The CMS detector explores a wide range of non-standard signatures including displaced and delayed particles, which allow to explore various models from supersymmetry and beyond standard models. Newly set limits on long-lived exotic particles will be presented. These results are obtained with data recorded in proton-proton collisions at $\sqrt{s} = 13$ TeV in Run 2 of the LHC.

Presenter: GECSE, Zoltan (Fermi National Accelerator Lab. (US))
