

## A SUSY Higgs boson at 96 GeV?

CMS presented a 3 sigma (local) excess in light Higgs-boson searches in the diphoton final state at around 96 GeV. ATLAS results do not exclude this possible signal. LEP published a 2 sigma (local) excess in the same mass range in the  $b\bar{b}$  final state. We present two SUSY models that can simultaneously explain both excesses, while being in agreement with all direct and indirect Higgs boson measurements and searches.
