

ATLAS production @ OLCF. August 6, 2018

- Titan got production tasks over last weekend
 - «Backfill» works well, and already processed >4M events.
 - ALCC was required a couple of tunes, and now a couple of workers corresponded to 1,6M events queued.
- Scale tests of Pilot2 with HPC workflow illuminated some issues, which got a workaround
 - In general, it's ready for production, but I prefer to have one more step of optimization, which should be done in coherent way with other workflows of Pilot2.
