## Measurements of triboson production at ATLAS

*Tuesday, 9 April 2019 14:26 (26 minutes)*

A search for the production of three massive vector bosons in  $WWW$ ,  $WWZ$  and  $WZZ$  final states is presented, using proton-proton collision data collected by the ATLAS experiment at  $\sqrt{s}=13$  TeV. The analysis utilises multiple search channels.  $WWW$  production is probed using a fully-leptonic decay channel, with three-charged leptons and missing transverse momentum, and a semi-leptonic decay channel with two-charged leptons and two hadronic jets.  $WWZ$  production is probed in both a fully leptonic decay channel (four charged leptons) and a semi-leptonic decay channel (three leptons and two hadronic jets), whereas  $WZZ$  production is probed using a semi-leptonic decay channel (four charged leptons and two hadronic jets). The signal strengths in each channel are extracted and combined in a global fit. The data are found to be in good agreement with the SM expectations.
