SIDIS in the LARGE q_T regime

Collinear Factorization:

$$\frac{d\sigma}{dx_{Bj} dy dz_h dP_T^2} = \left(\frac{\alpha_S}{\pi}\right) \sum_{ij} \int_{x_{Bj}}^{x_{MAX}} \frac{dx}{x} \int_{z_h}^{z_{MAX}} \frac{dz}{z} \times \\ \times f_i\left(\frac{x_{Bj}}{x}, Q^2\right) \left[\frac{d\hat{\sigma}_{ij}}{dx dy dz dq_T^2} \delta\left(z^2 Q^2 \left(\frac{P_T^2}{z_h} - \frac{1-x}{x} \frac{1-z}{z}\right)\right) \right] D_j\left(\frac{z_h}{z}, Q^2\right)$$

In general:

$$\text{MEASURED} \longrightarrow \mathcal{O} = H \otimes \sum_i F_i \longleftarrow \text{EXTRACTED from experimental data}$$

COMPUTED at FO
in perturbation theory

Depending on the α_s order the collinear functions will be labeled by: LO, NLO, NNLO...

Comparison with COMPASS data

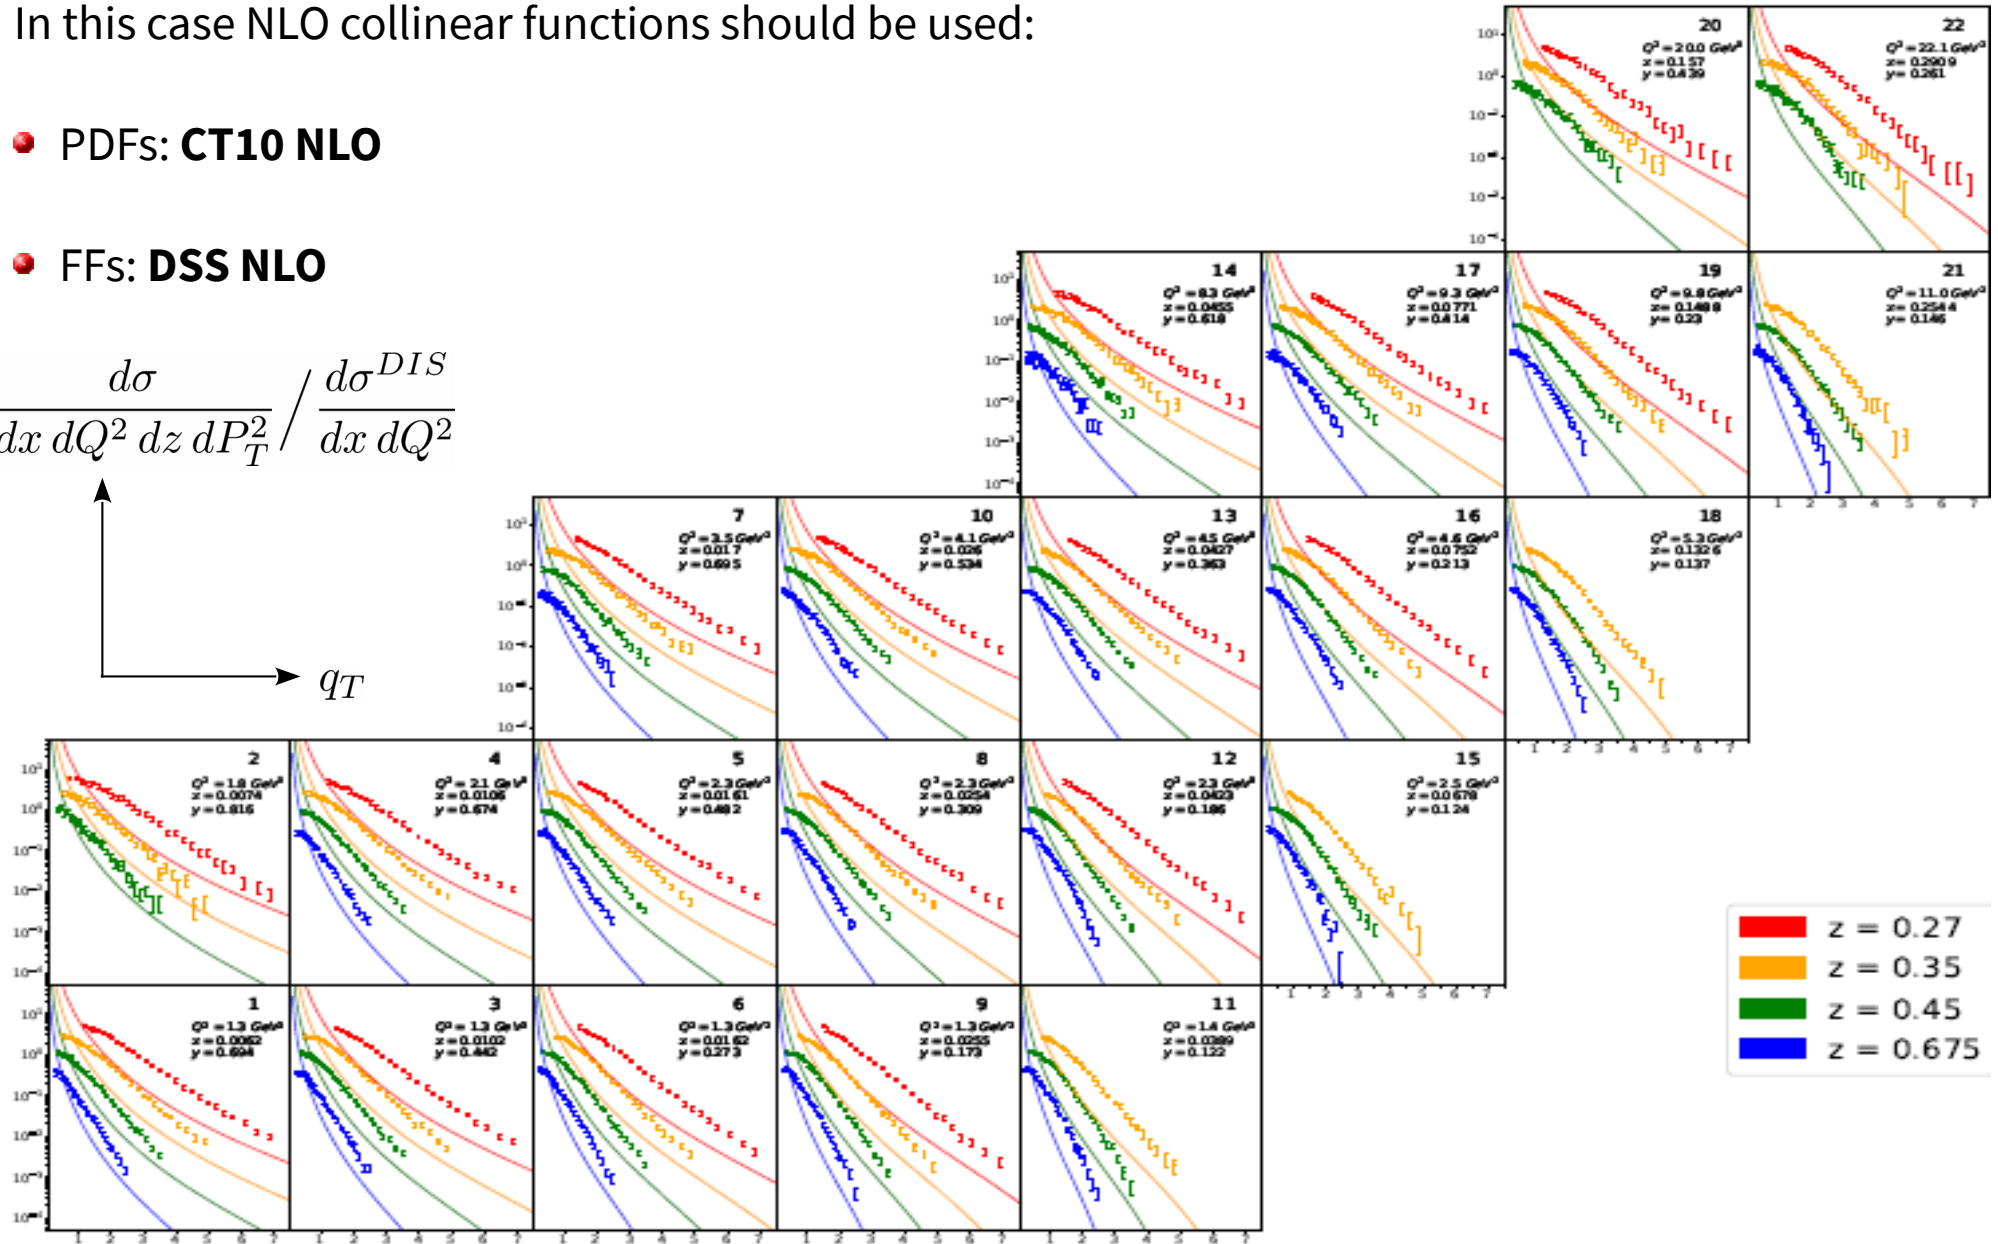

In this case NLO collinear functions should be used:

PDFs: **CT10 NLO**

FFs: **DSS NLO**

$$\frac{d\sigma}{dx dQ^2 dz dP_T^2} / \frac{d\sigma^{DIS}}{dx dQ^2}$$

q_T

Comparison with COMPASS data

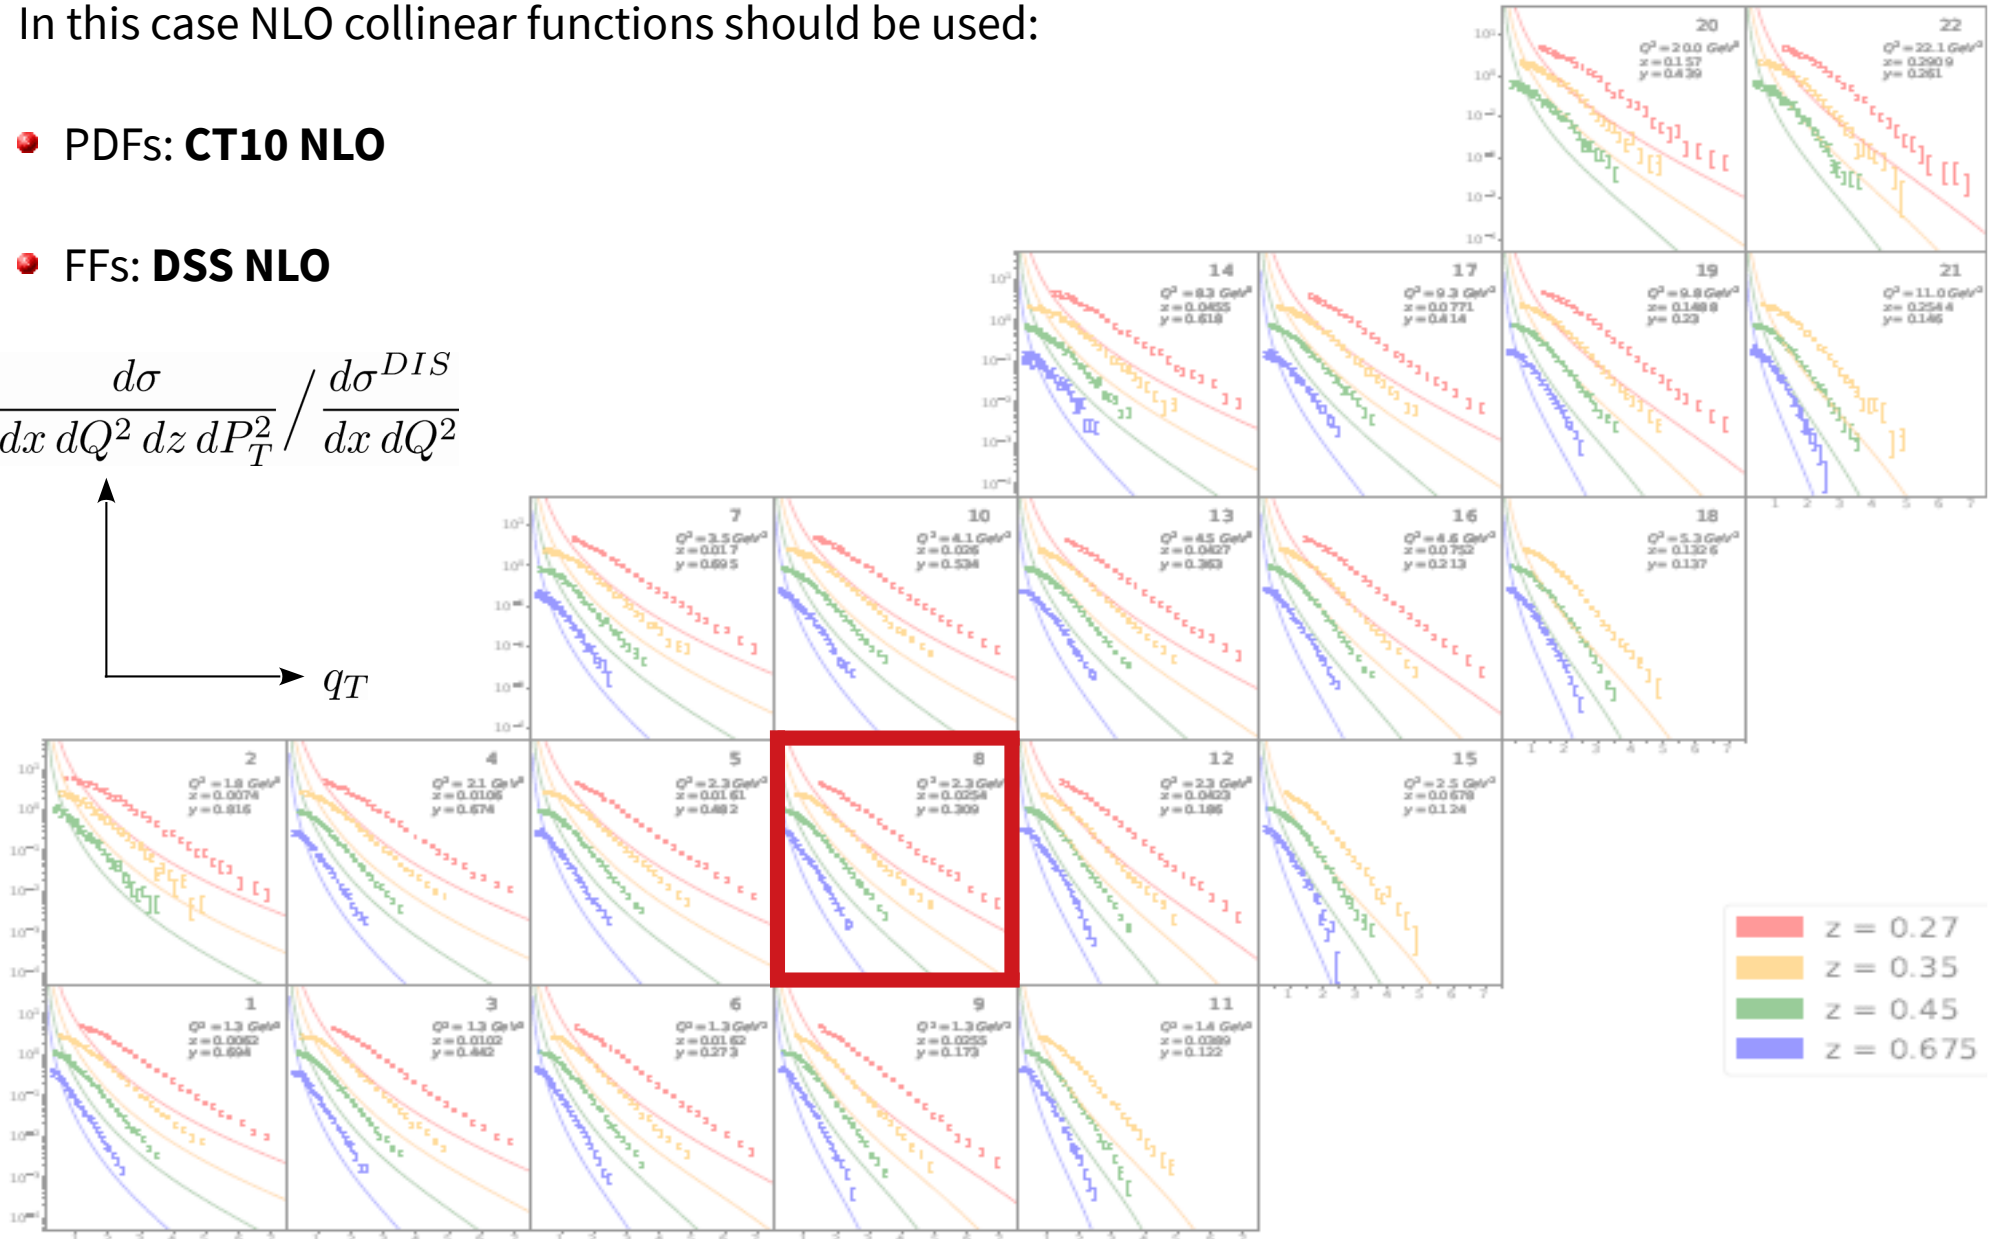

In this case NLO collinear functions should be used:

PDFs: **CT10 NLO**

FFs: **DSS NLO**

$$\frac{d\sigma}{dx dQ^2 dz dP_T^2} \bigg/ \frac{d\sigma^{DIS}}{dx dQ^2}$$

q_T

Comparison with COMPASS data

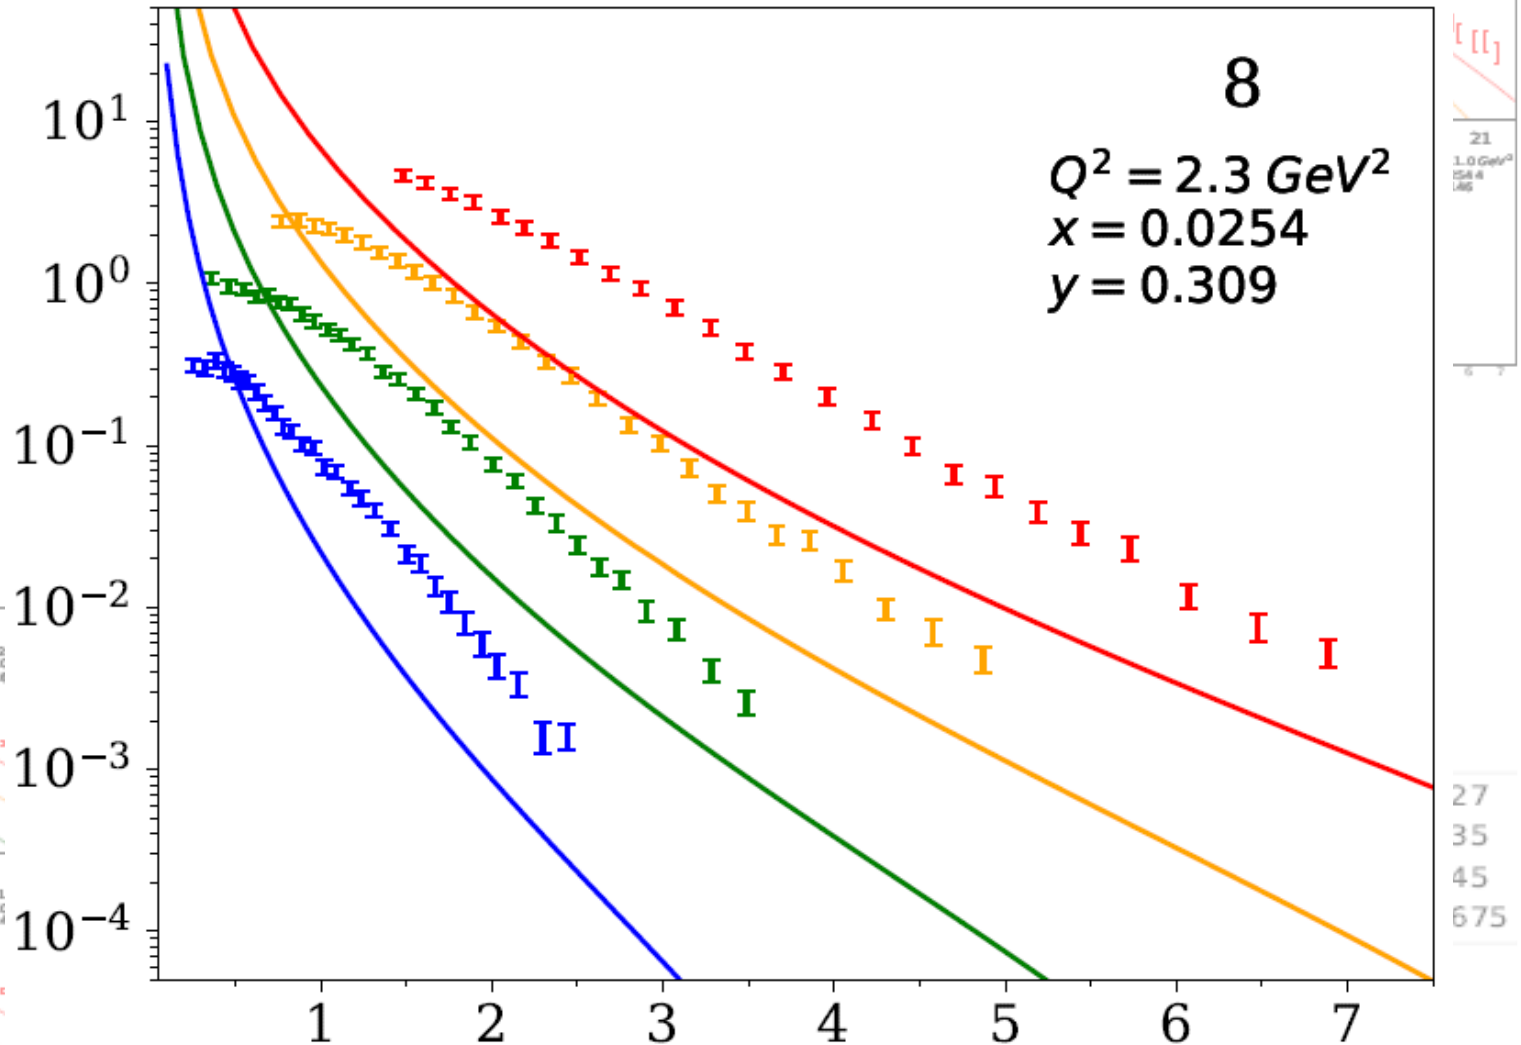

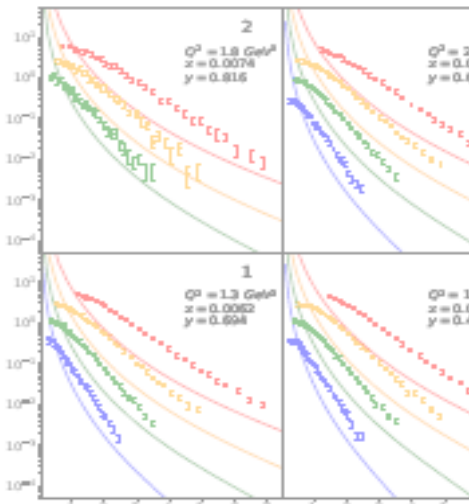

In this case NLO collinear functions should be used:

PDFs: **CT10 NLO**

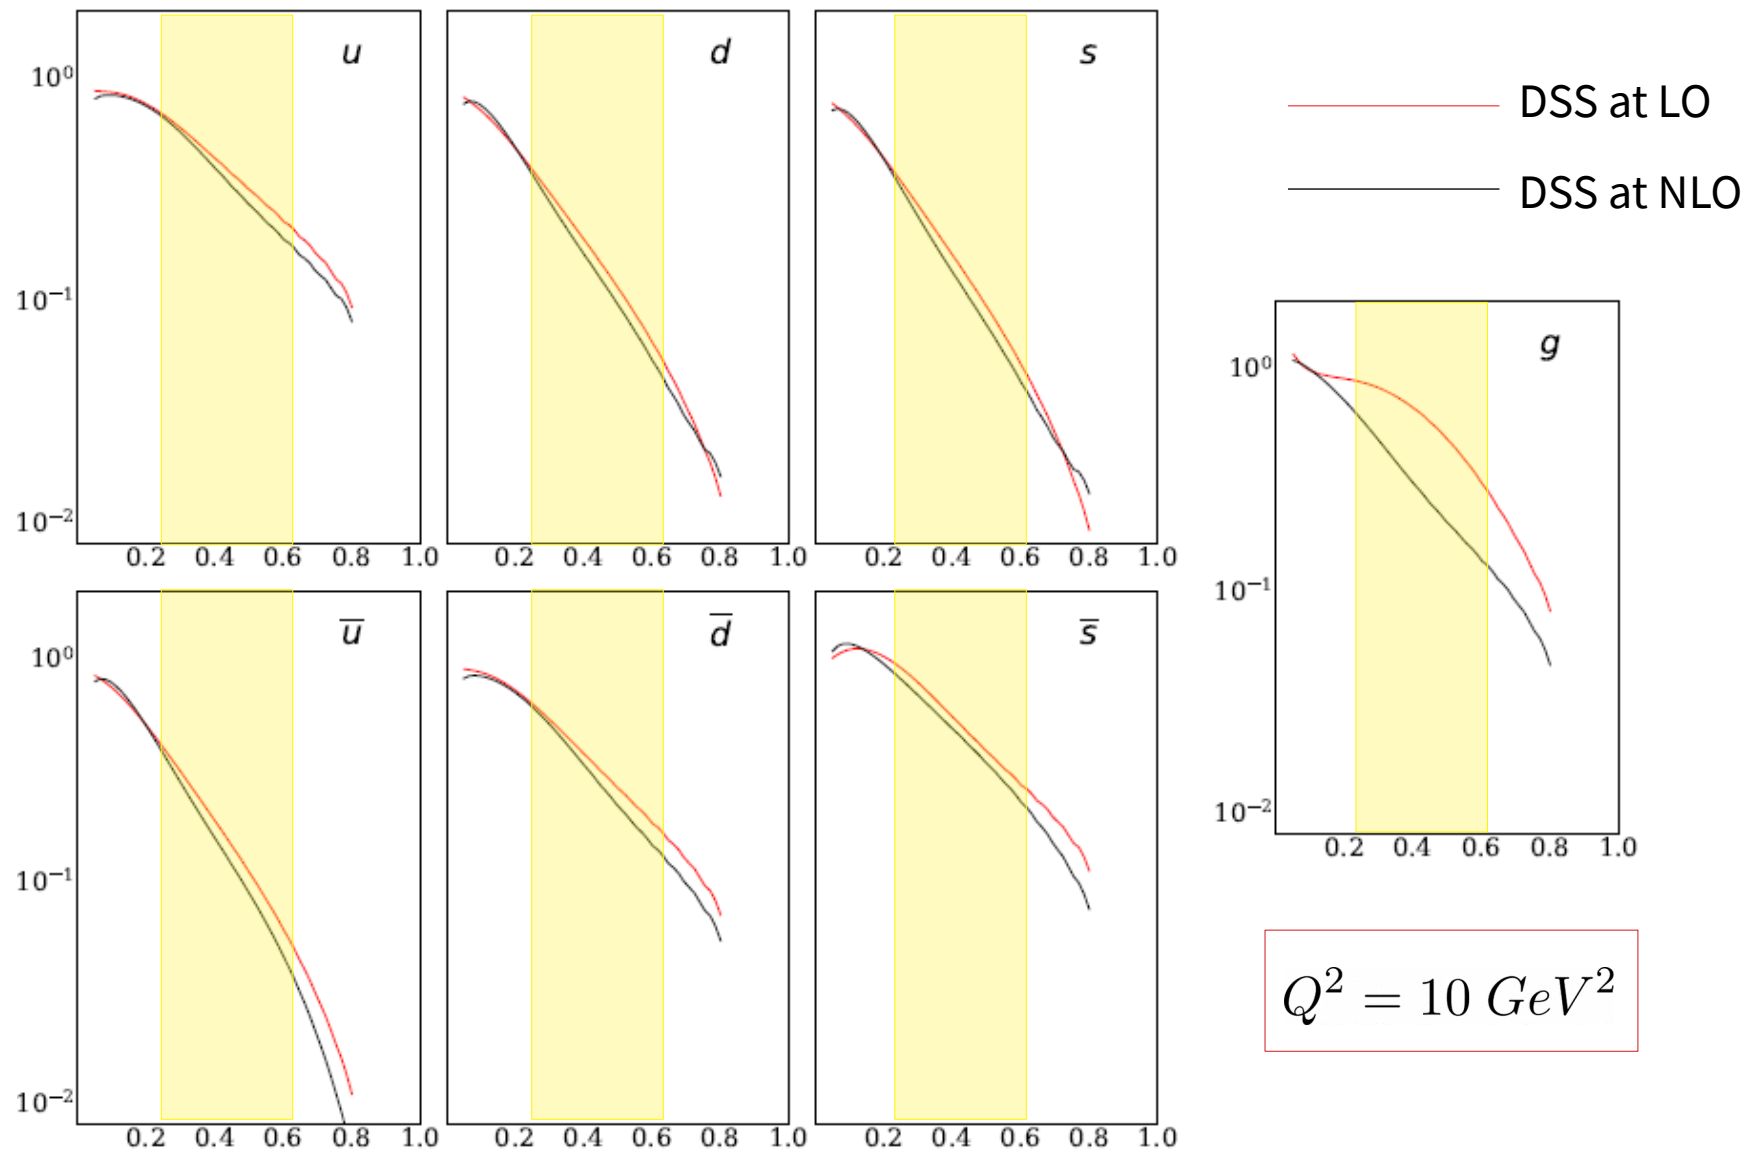

FFs: **DSS NLO**

$$\frac{d\sigma}{dx dQ^2 dz dP_T^2} \bigg/ \frac{d\sigma^{DIS}}{dx dQ^2}$$

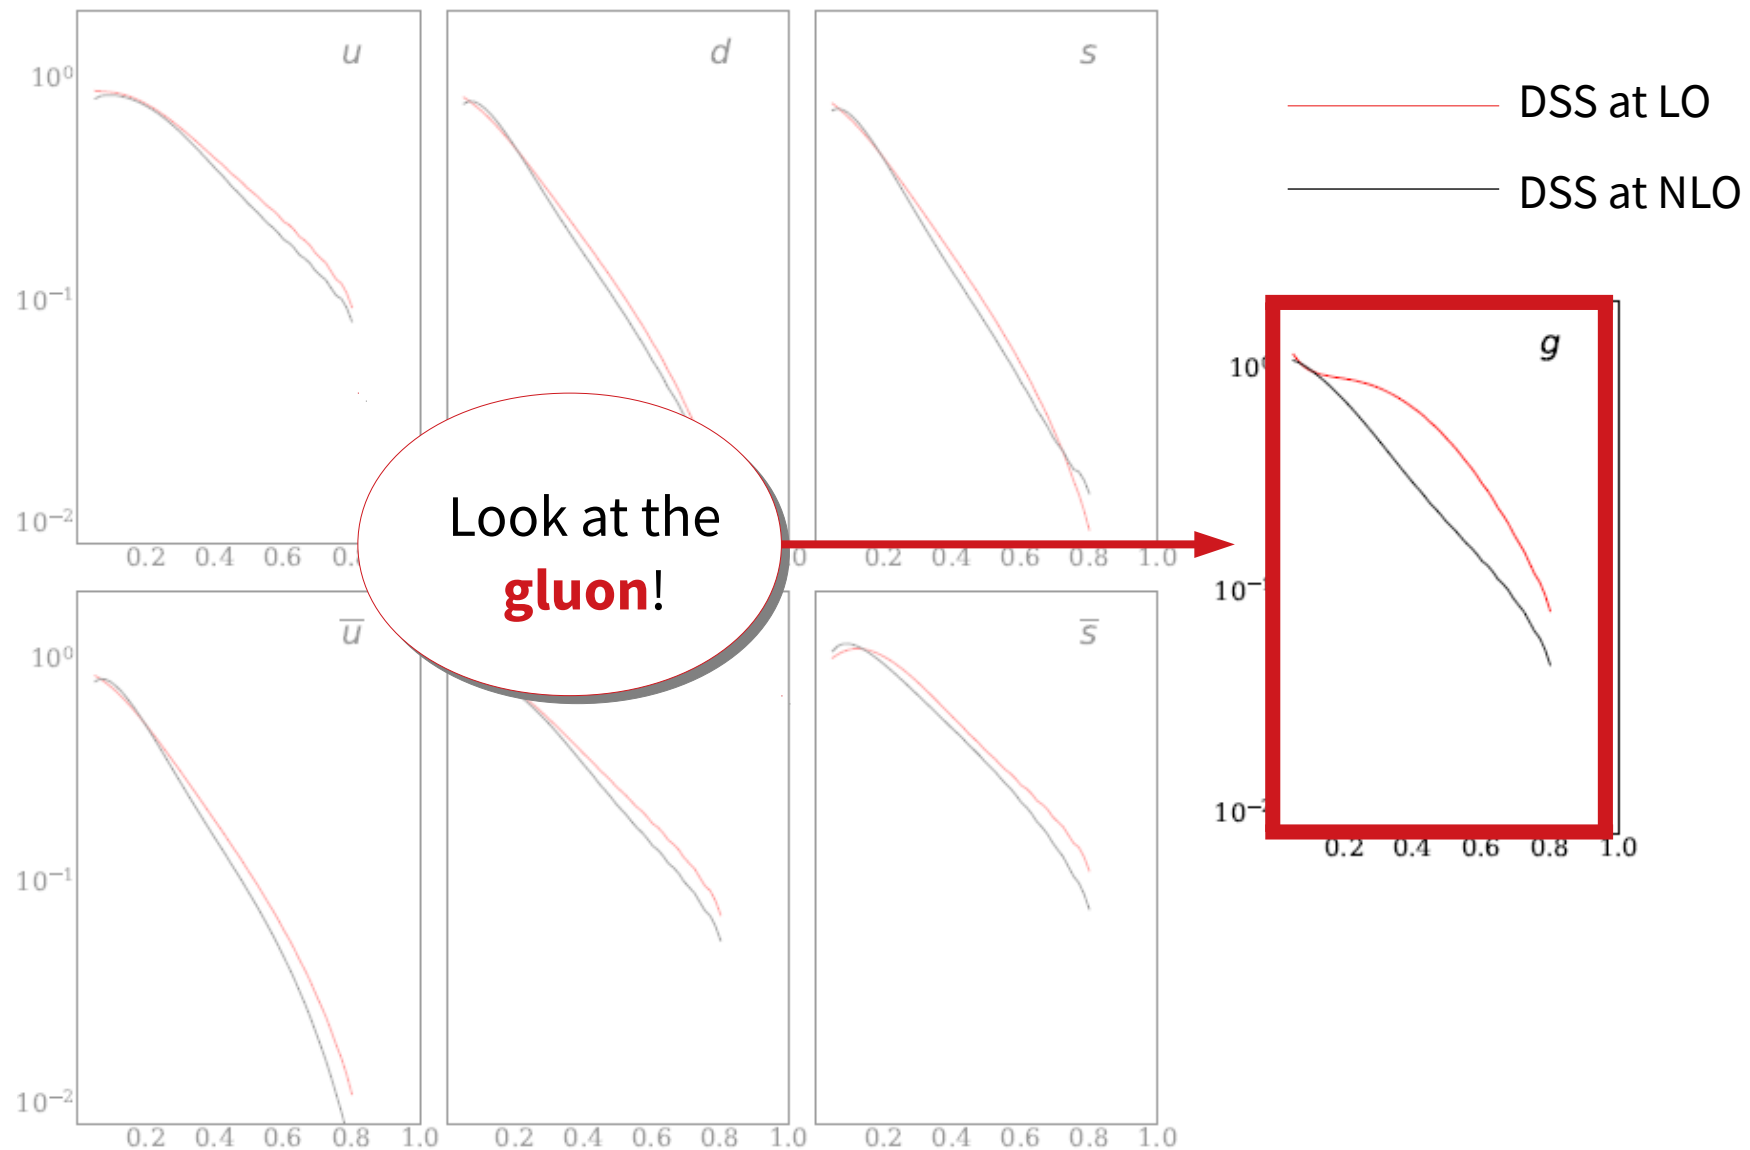

q_T

A different choice for FFs

A different choice for FFs

Comparison with COMPASS DATA

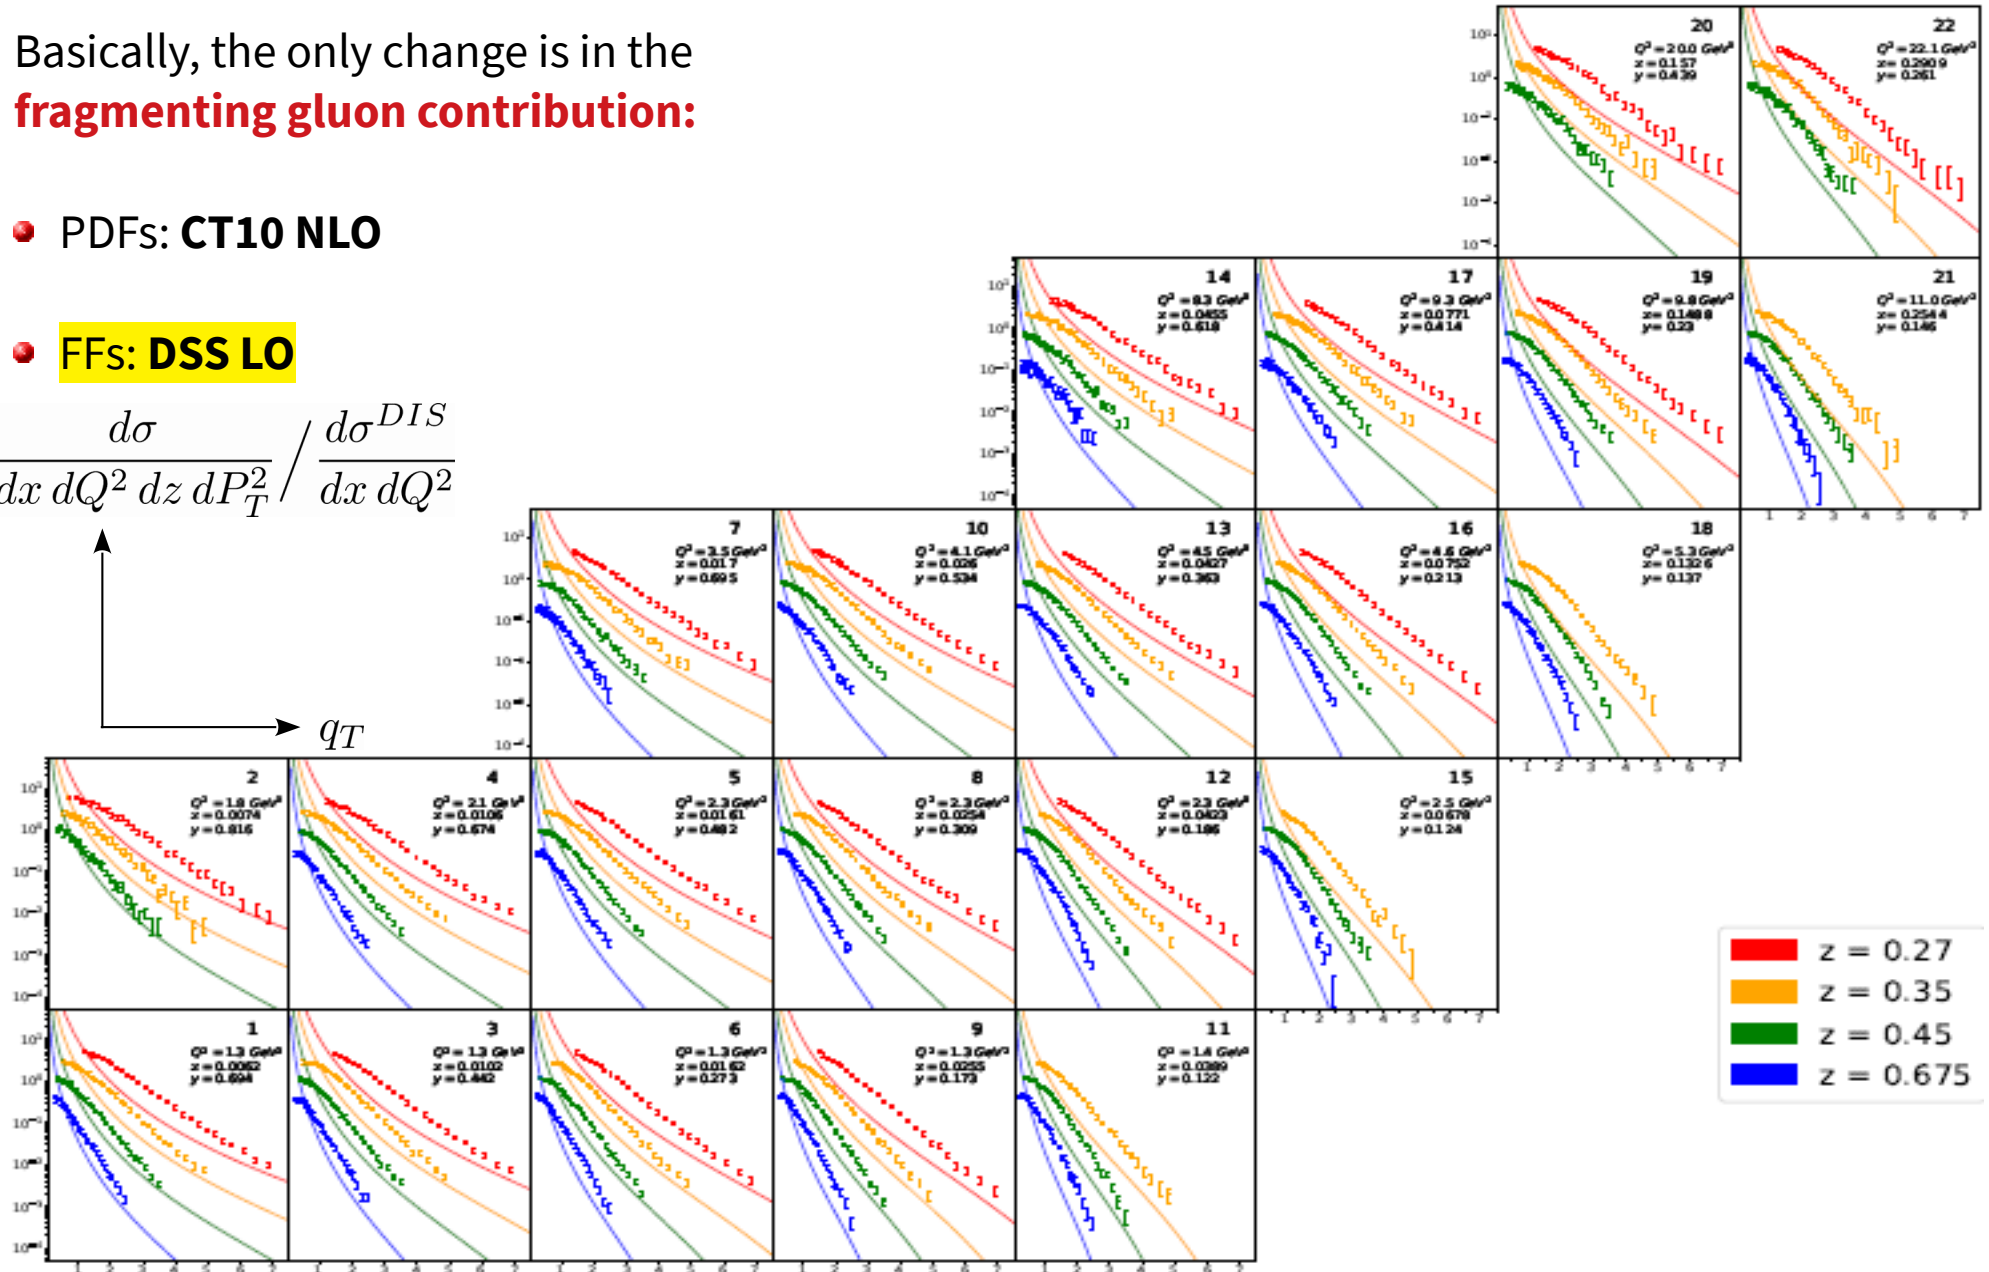

Basically, the only change is in the
fragmenting gluon contribution:

PDFs: **CT10 NLO**

FFs: **DSS LO**

$$\frac{d\sigma}{dx dQ^2 dz dP_T^2} / \frac{d\sigma^{DIS}}{dx dQ^2}$$

Errors and Collinear Functions

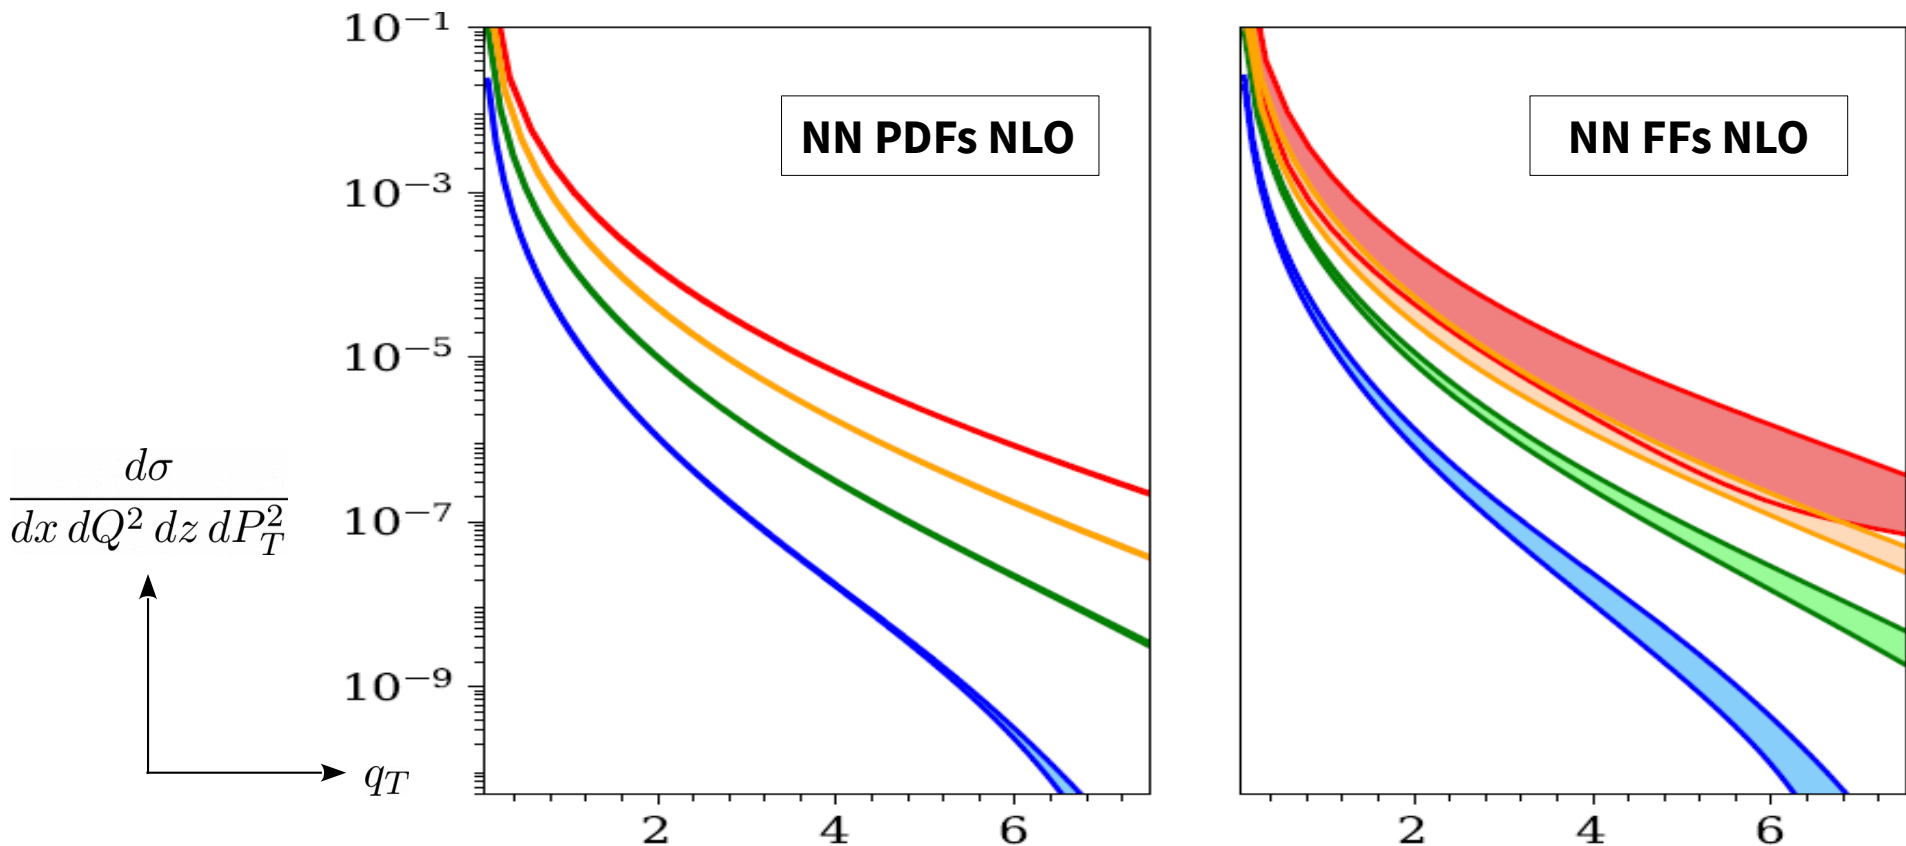

How much does the **error associated to the extraction of the collinear functions** affect the SIDIS cross section at large q_T ?

$$Q^2 = 2.1 \text{ GeV}^2$$

$$x = 0.0106$$

$$y = 0.674$$

NEURAL NETWORK SETS

Errors and Collinear Functions

How much the

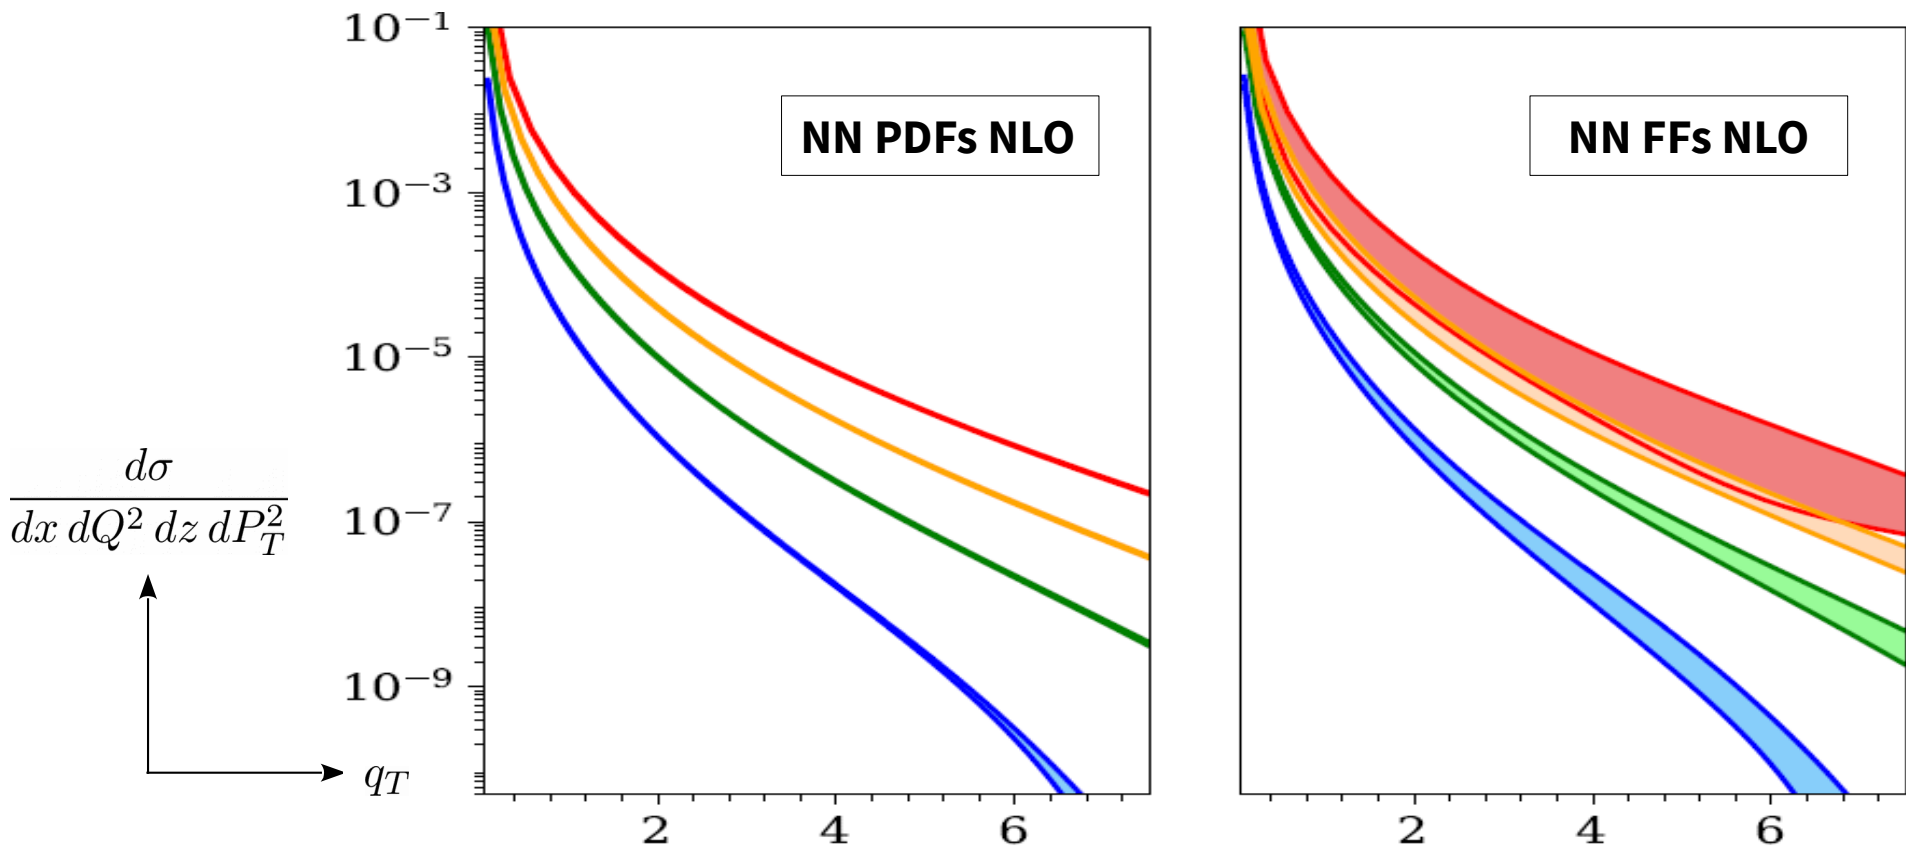

The error associated to the PDFs is **negligible** in comparison with that of FFs.

$$Q^2 = 2.1 \text{ GeV}^2$$

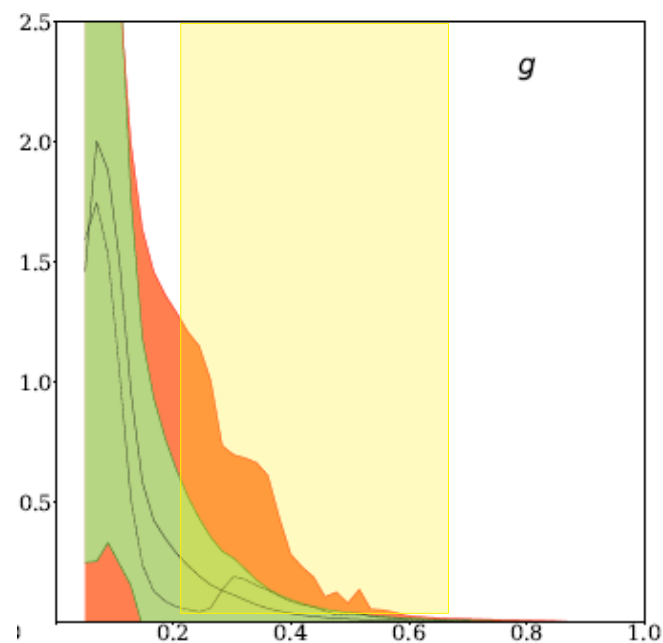

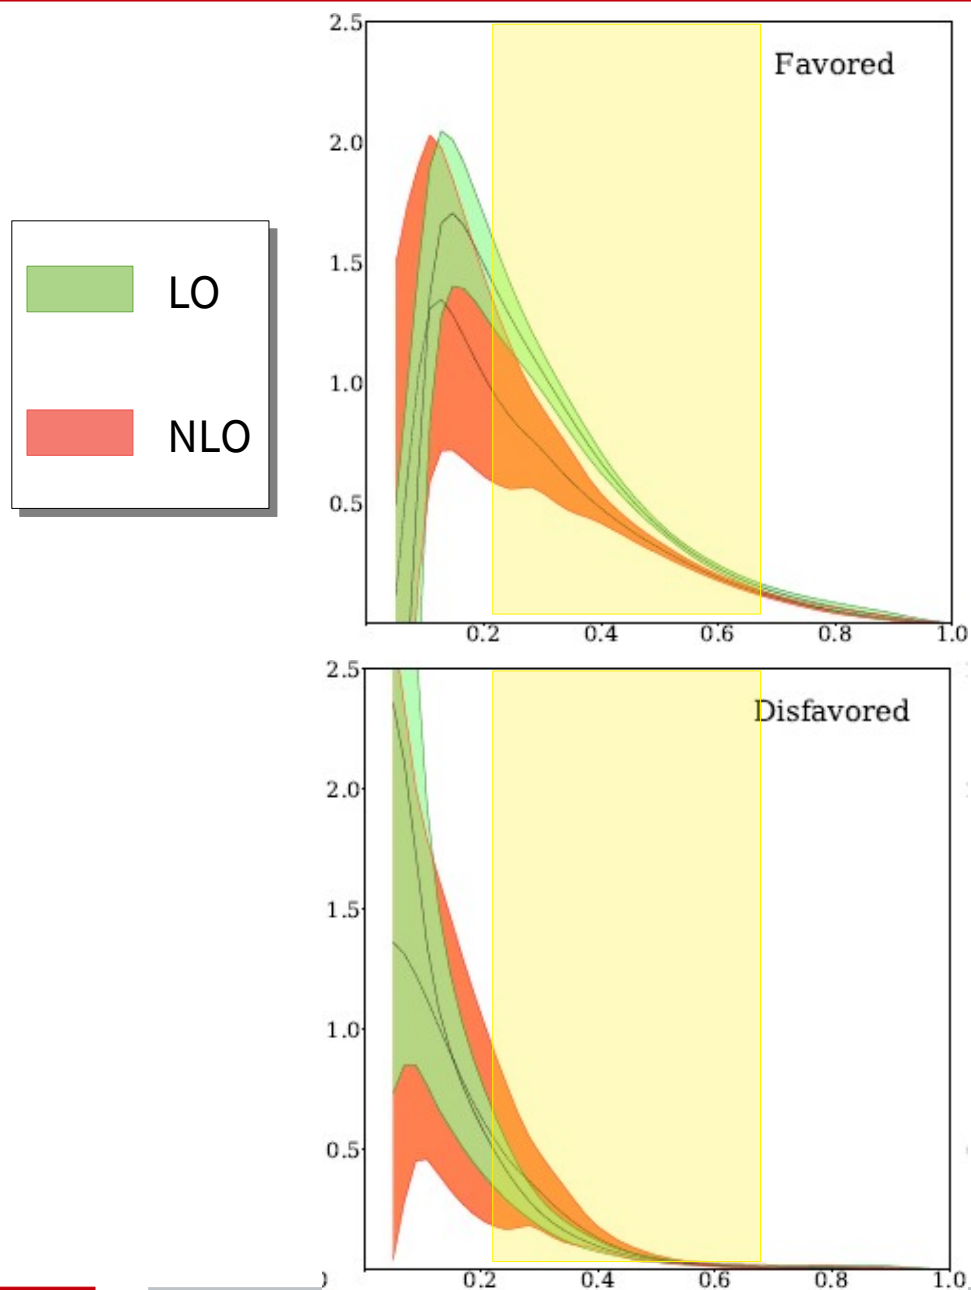

$$x = 0.0106$$

$$y = 0.674$$

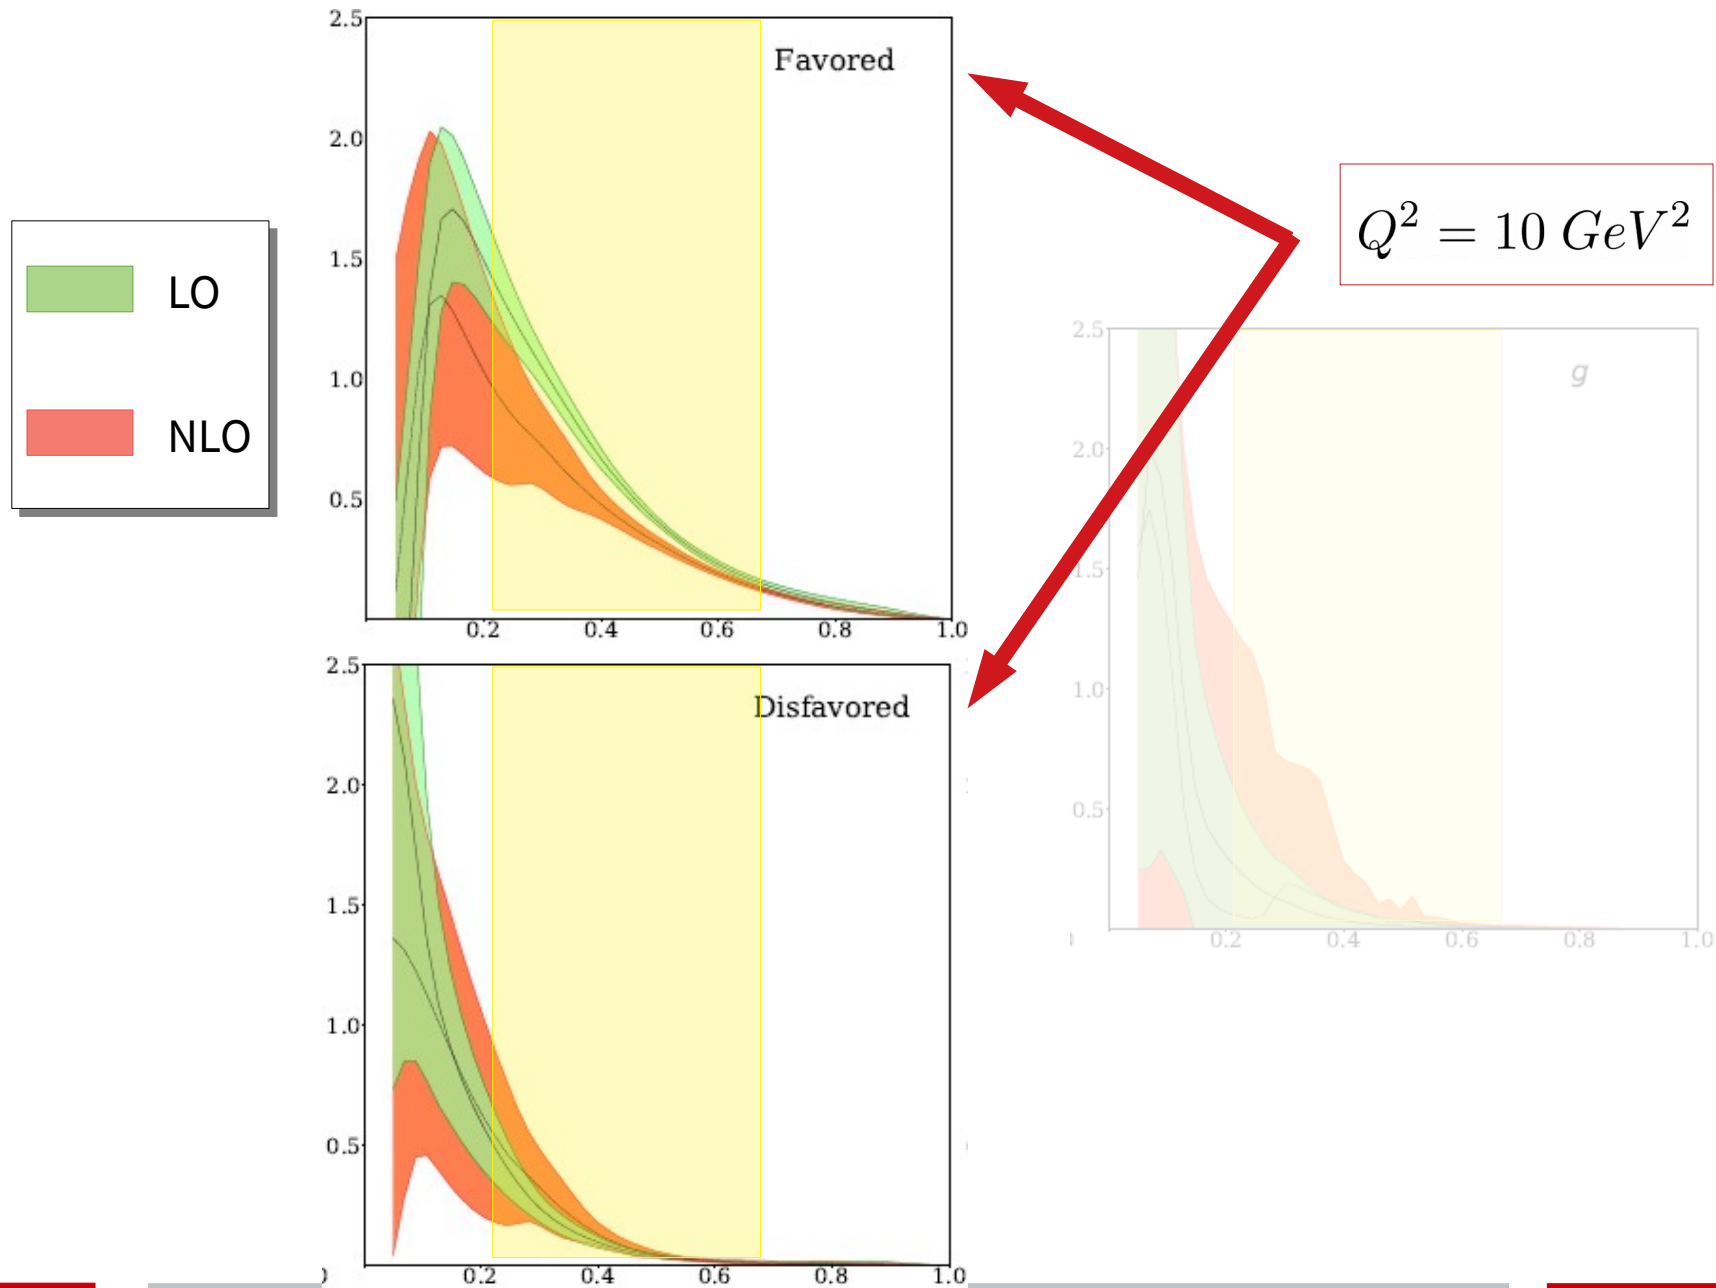

NEURAL NETWORK SETS

Neural Network FFs

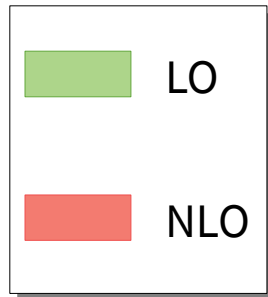

Neural Network FFs

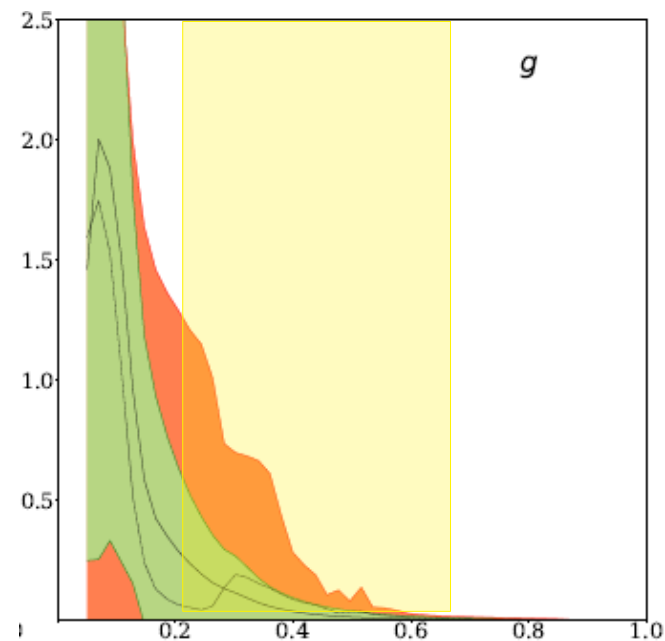

Neural Network FFs

WARNING!

The FFs are extracted from $e^+ e^-$ data, at values of Q^2 much larger than in COMPASS.

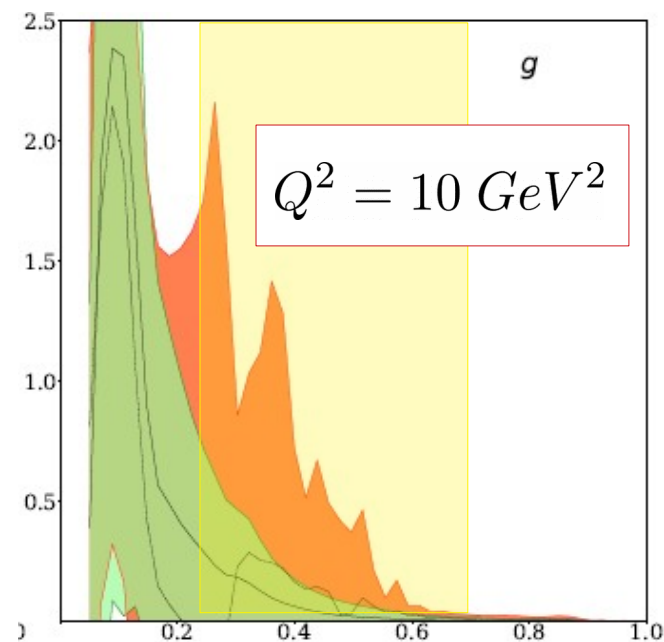

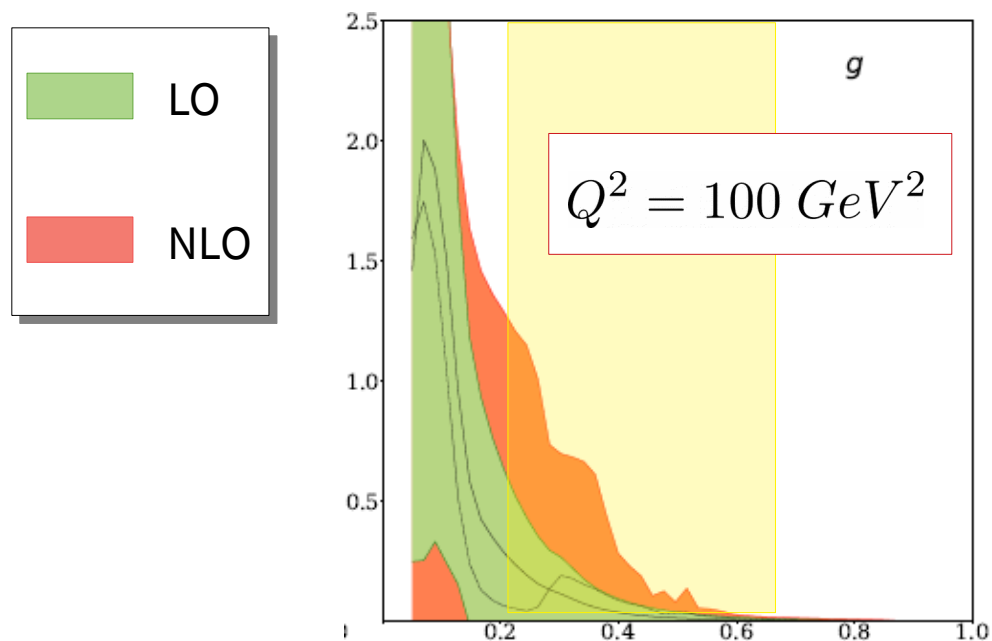

$$Q^2 = 100 \text{ GeV}^2$$

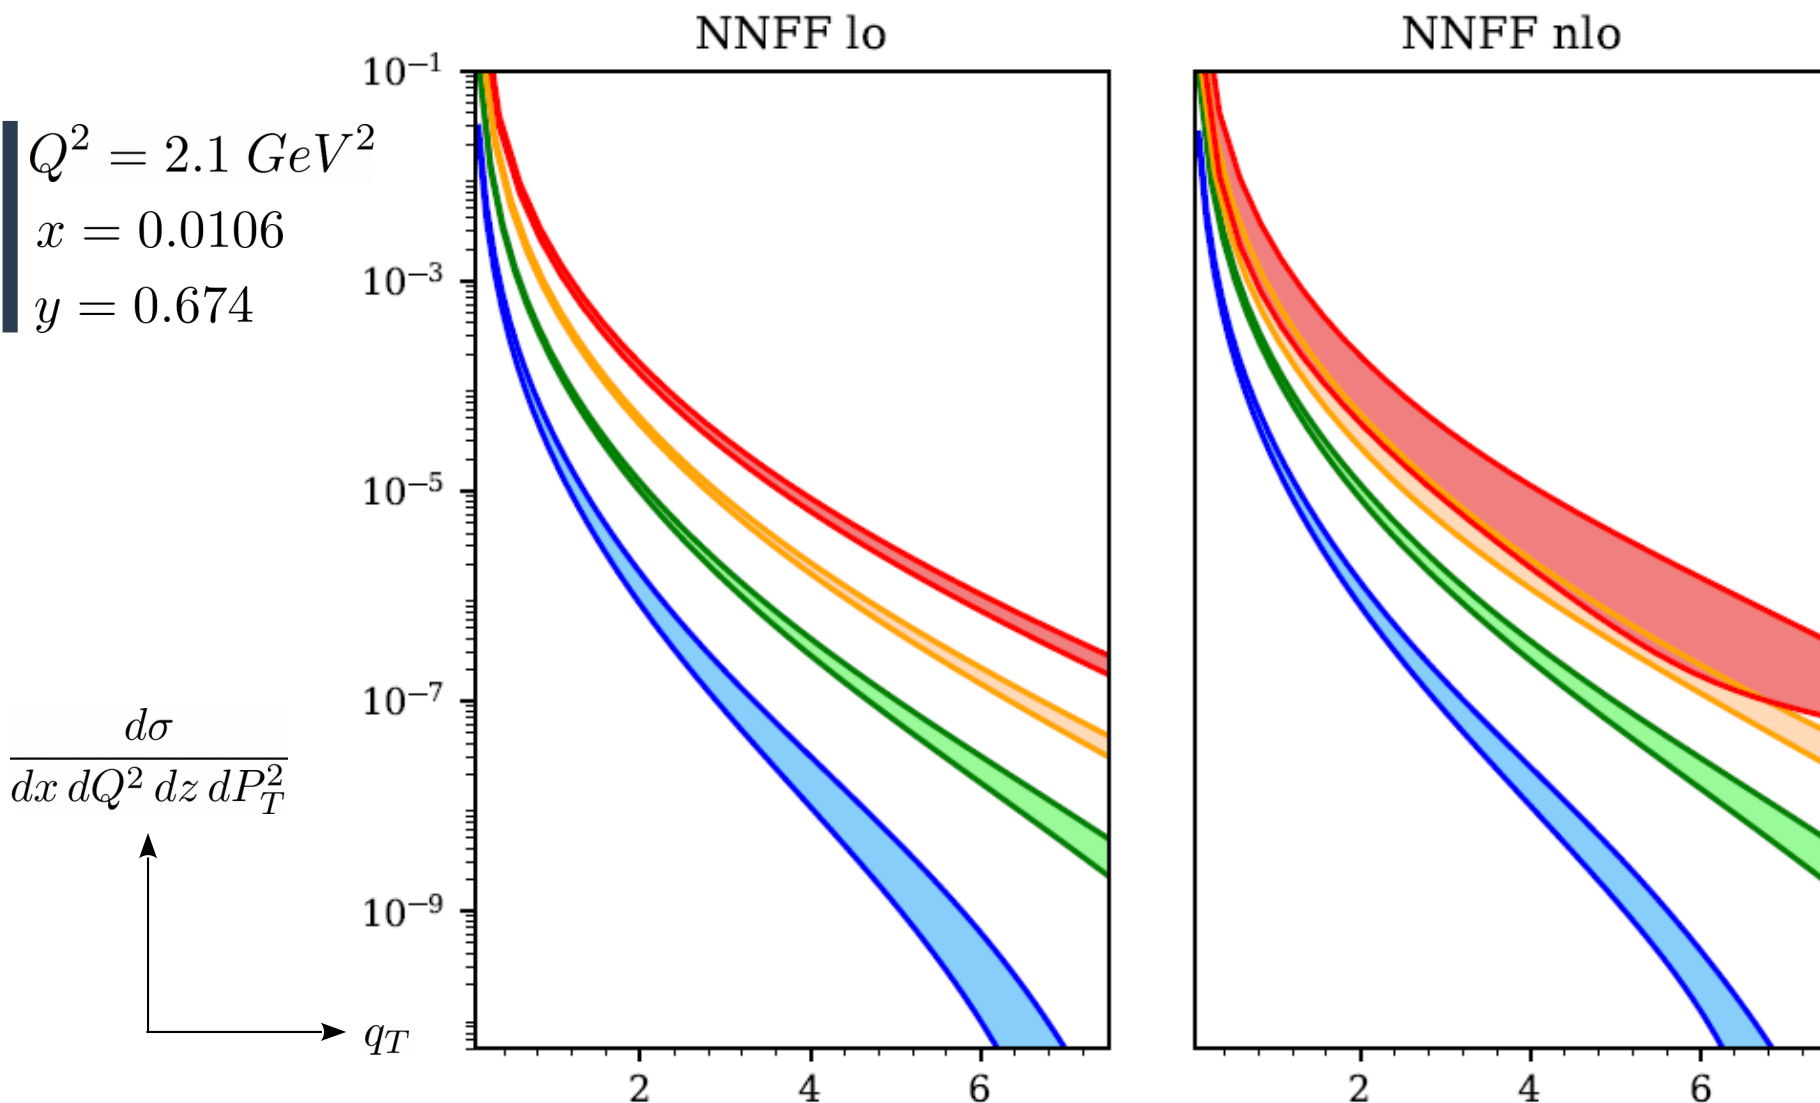

NN FF at NLO vs NN FFs at LO

...This is what happens using a COMPASS-like Q^2 :

NN FFs: Comparison in the SIDIS cross section

The error bars associated to NLO FFs are on average **larger**:

SIDIS in the LOW q_T regime

TMD Factorization:

$$\frac{d\sigma}{dx_{Bj} dy dz_h dq_T^2} = \pi z^2 H(Q; \mu) \int \frac{d^2 \vec{b}_T}{(2\pi)^2} e^{i \vec{q}_T \cdot \vec{b}_T} \sum_j e_j^2 \tilde{F}(x, b_T, \mu, \zeta_F) \tilde{D}(z, b_T, \mu, \zeta_D)$$

TMD FUNCTIONS

The **TMD PDF** is a complex object...

$$\begin{aligned} \tilde{F}(x, b_T, \mu, \zeta_F) = & \sum_j \int_x^1 \frac{d\hat{x}}{\hat{x}} C_{fj} \left(\frac{x}{\hat{x}} \right) f_j(\hat{x}, \mu_b) \times \\ & \times \exp \left\{ \frac{1}{2} \log \left(\frac{\zeta_F}{\mu^2} \right) \tilde{K}(b_* \mu_b) + \int_{\mu_b}^Q \frac{d\mu}{\mu} \gamma_F \left(\mu, \frac{\zeta_F}{\mu^2} \right) \right\} \times M_F(x, b_T) \end{aligned}$$

“A study on the interplay between perturbative QCD and CSS/TMD formalism in SIDIS processes”

SIDIS in the LOW q_T regime

TMD Factorization:

$$\frac{d\sigma}{dx_{Bj} dy dz_h dq_T^2} = \pi z^2 H(Q; \mu) \int \frac{d^2 \vec{b}_T}{(2\pi)^2} e^{i \vec{q}_T \cdot \vec{b}_T} \sum_j e_j^2 \tilde{F}(x, b_T, \mu, \zeta_F) \tilde{D}(z, b_T, \mu, \zeta_D)$$

Same collinear functions used in collinear factorization!

TMD FUNCTIONS

The **TMD PDF** is a complex object...

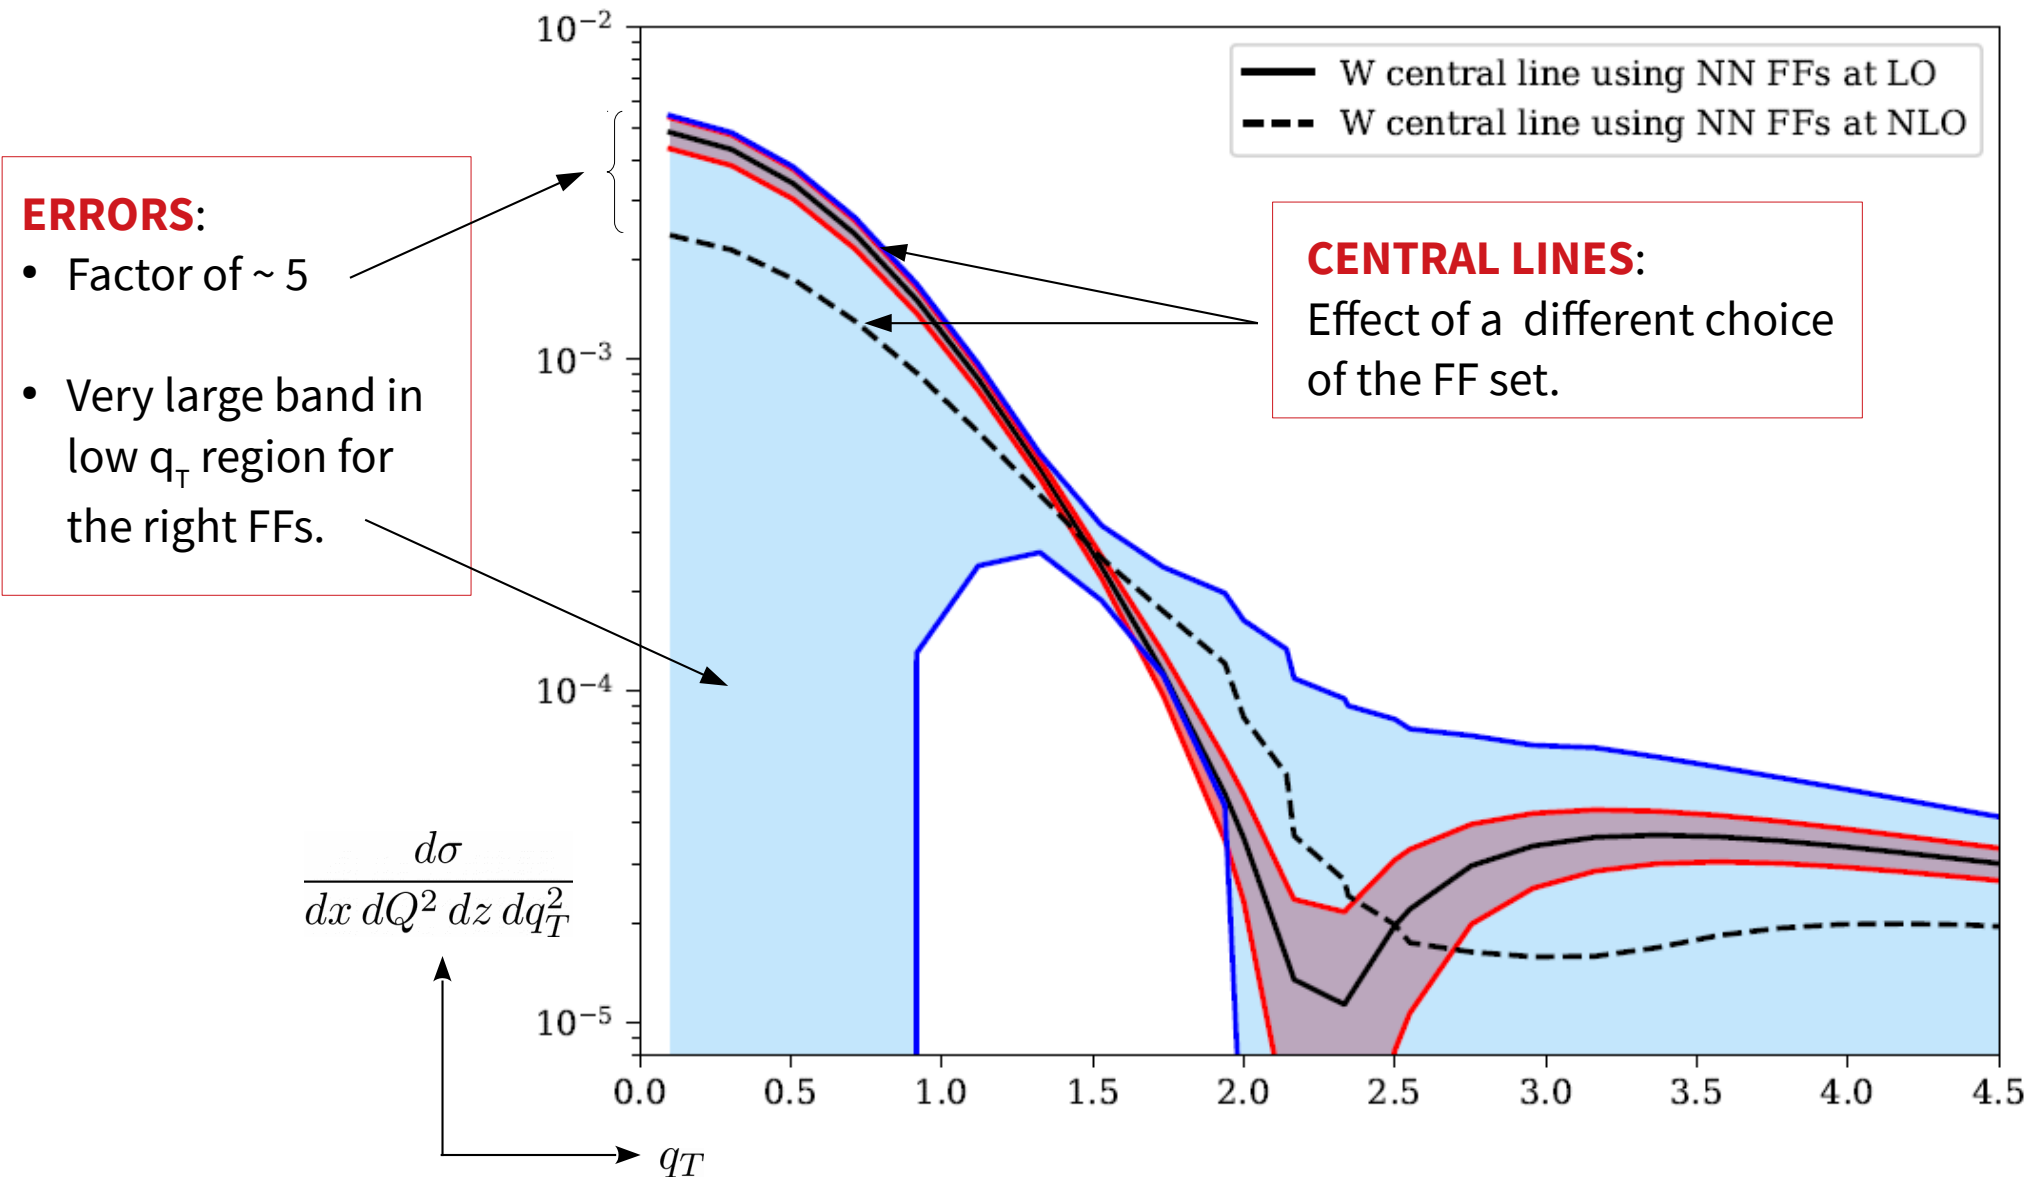

$$\tilde{F}(x, b_T, \mu, \zeta_F) = \sum_j \int_x^1 \frac{d\hat{x}}{\hat{x}} C_{fj} \left(\frac{x}{\hat{x}} \right) f_j(\hat{x}, \mu_b) \times$$

$$\times \exp \left\{ \frac{1}{2} \log \left(\frac{\zeta_F}{\mu^2} \right) \tilde{K}(b_* \mu_b) + \int_{\mu_b}^Q \frac{d\mu}{\mu} \gamma_F \left(\mu, \frac{\zeta_F}{\mu^2} \right) \right\} \times M_F(x, b_T)$$

Errors of Collinear Functions in the W-TERM

BACK UP SLIDES

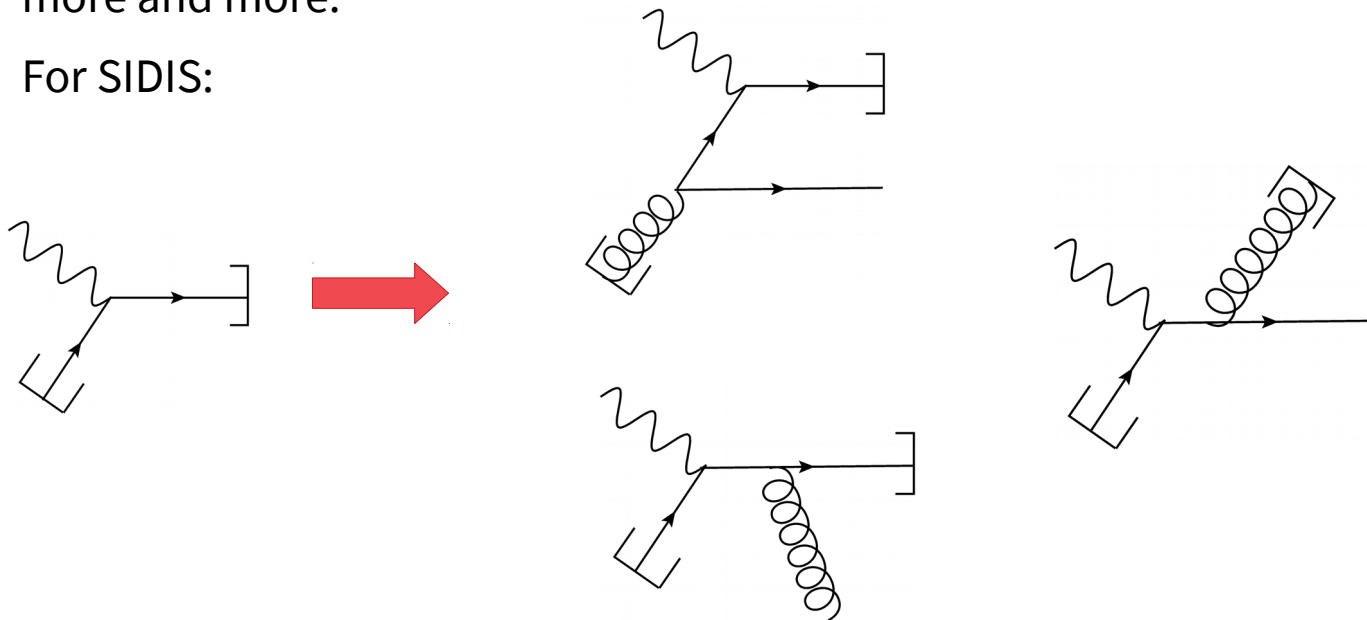

A different choice for FFs

Let's consider again the collinear factorization theorem:

$$\mathcal{O} = H \otimes \sum_i F_i$$

As the order of α_s increases,
the **HARD** part grows
since the **phase space enlarges**
more and more.

For SIDIS:

As a consequence the
COLLINEAR FUNCTIONS
contribution decreases.

NN FFs: Comparison in the SIDIS cross section

Central lines for NN FFs:
