

# 10th International Conference on Hard and Electromagnetic Probes of High-Energy Nuclear Collisions

Contribution ID: 16

Type: Oral Presentation

## Flavor hierarchy of jet quenching in relativistic heavy-ion collisions

*Monday, 1 June 2020 12:55 (20 minutes)*

Relativistic heavy-ion experiments have observed similar quenching effects for (prompt)  $D$  mesons compared to charged hadrons for transverse momenta larger than 6-8 GeV, which remains a mystery since heavy quarks typically lose less energies in quark-gluon plasma than light quarks and gluons. Recent measurements of the nuclear modification factors of  $B$  mesons and  $B$ -decayed  $D$  mesons by the CMS Collaboration provide a unique opportunity to study the flavor hierarchy of jet quenching. Using a linear Boltzmann transport model combined with hydrodynamics simulation, we study the energy loss and nuclear modification for heavy and light flavor jets in high-energy nuclear collisions. By consistently taking into account both quark and gluon contributions to light and heavy flavor hadron productions within a next-to-leading order perturbative QCD framework, we obtain, for the first time, a satisfactory description of the experimental data on the nuclear modification factors for charged hadrons,  $D$  mesons,  $B$  mesons and  $B$ -decayed  $D$  mesons simultaneously over a wide range of transverse momenta (8-300 GeV). This presents a solid solution to the flavor puzzle of jet quenching and constitutes a significant step towards the precision study of jet-medium interaction. Our study predicts that at transverse momenta larger than 30-40 GeV,  $B$  mesons also exhibit similar suppression effects to charged hadrons and  $D$  mesons, which may be tested by future measurements.
