

10th International Conference on Hard and Electromagnetic Probes of High-Energy Nuclear Collisions

Contribution ID: 102

Type: Oral Presentation

X(3872) production in pp with particle multiplicity

Wednesday, June 3, 2020 12:25 PM (20 minutes)

The last decade of hadron spectroscopy has unveiled a wealth of states that do not have the properties expected of particles composed of 2 or 3 valence quarks. Among the most intriguing of these exotics is the X(3872), which various models attempt to describe as a hadronic molecule, a compact tetraquark, an unexpected charmonium state, or their mixtures. Heavy ion collisions, as well as high multiplicity pp collisions, offer a new window on the properties of this poorly understood hadron. In these systems, promptly produced X(3872) hadrons can interact with other particles in the nucleus and/or those produced in the collision. The influence of these interactions on the observed X(3872) yields provides information that can help discriminate between the various models of its structure, as well as give insight into the dynamics of the bulk particles produced in these collisions. With a full range of precision vertexing, tracking, and particle ID capabilities covering 2 to 5 in units of rapidity, the LHCb experiment is especially well suited to measurements of both prompt and non-prompt exotic hadrons.

This talk will present new LHCb measurements X(3872) production in high multiplicity pp collisions through the decay to $J/\psi\pi^+\pi^-$.

Collaboration (if applicable)

LHCb

Track

Heavy Flavor and Quarkonia

Contribution type

Contributed Talk

Authors: RICCIARDI, Stefania (Science and Technology Facilities Council STFC (GB)); LHCb COLLABORATION

Presenter: DEAN, Cameron (Los Alamos National Laboratory (US))

Session Classification: Parallel

Track Classification: Heavy Flavor and Quarkonia
