Contribution ID: 43

Type: Oral Presentation

ATLAS measurements of transverse and longitudinal flow decorrelations in Xe+Xe, Pb+Pb, and p +Pb collisions

Wednesday, June 3, 2020 10:30 AM (20 minutes)

ATLAS measurements of flow harmonics (v_n) and their fluctuations in Pb+Pb and Xe+Xe collisions covering a wide range of transverse momenta, pseudorapidity and collision centrality are presented. The measurements are performed using data from Xe+Xe collisions at 5.44 TeV, Pb+Pb collisions at 5.02 TeV, and p +Pb collisions at 5.02 and 8.16 TeV. The v_n are measured up to $n = 6$ using the two-particle correlations, multi-particle cumulants, and scalar product methods. The v_n values are also performed using a non-flow subtraction technique that was developed for flow measurements in pp and p +Pb collisions. This non-flow subtraction is found to have a significant effect on the measured v_n at high- p_T and in peripheral collisions. A universal scaling in the p_T dependence of the v_n is observed for both systems.

Measurements of correlations between the v_n for different order n , studied with three- and four-particle mixed-harmonic cumulants, are also presented, and contributions to these correlations from “centrality fluctuations” are also discussed. Measurements of longitudinal flow decorrelations involving two- and four-particle correlations for v_2 and v_3 in Xe+Xe and p +Pb collisions are also presented and compared with the corresponding measurements in Pb+Pb collisions. The four-particle decorrelation is found to not factorize as a product of two-particle decorrelations. The ability of such measurements to distinguish between different models of initial geometry and to reduce the uncertainty in determining the effective shear-viscosity to entropy-density ratio of the QGP is demonstrated.
