DIS in the Dipole Picture at leading order

Leading order $\gamma^* - p$ scattering

DIS in the Dipole Picture at leading order

Leading order $\gamma^* - p$ scattering

In Dipole Picture at Leading Order $\gamma^* p$ cross section using *optical theorem*:

$$\sigma_{L,T}^{\text{LO}}(x_{Bj}, Q^2) \sim 4N_c \alpha_{em} \sum_f e_f^2 \int_0^1 dz_1 \int_{\mathbf{x}_0, \mathbf{x}_1} \left| \Psi_{\gamma_{L,T}^* \rightarrow q\bar{q}} \right|^2 N(\mathbf{x}_{01}),$$

$$1 - N(\mathbf{x}_{01}) \equiv S_{01} := 1/N_c \left\langle \text{Tr } U(\mathbf{x}_0) U^\dagger(\mathbf{x}_1) \right\rangle_x$$

U = Wilson line

Target evolution: BK equation

Target evolution is described approximatively¹ by the Balitsky-Kovchegov (BK) equation:

$$\partial_y \langle S_{01} \rangle_y = \frac{\bar{\alpha}_s}{2\pi} \int d^2 \mathbf{x}_2 \frac{\mathbf{x}_{01}^2}{\mathbf{x}_{02}^2 \mathbf{x}_{21}^2} [\langle S_{02} \rangle_y \langle S_{21} \rangle_y - \langle S_{01} \rangle_y].$$

¹Mean field (large N_c) approx. of B-JIMWLK

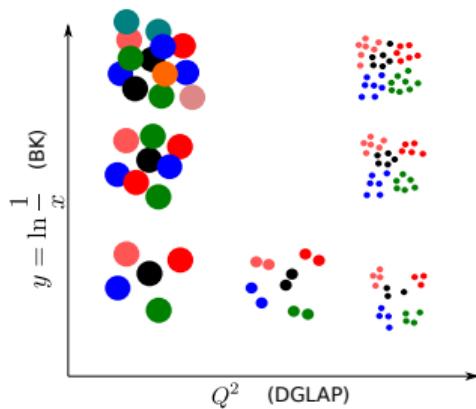

Target evolution: BK equation

Target evolution is described approximatively¹ by the Balitsky-Kovchegov (BK) equation:

$$\partial_y \langle S_{01} \rangle_y = \frac{\bar{\alpha}_s}{2\pi} \int d^2 \mathbf{x}_2 \frac{\mathbf{x}_{01}^2}{\mathbf{x}_{02}^2 \mathbf{x}_{21}^2} [\langle S_{02} \rangle_y \langle S_{21} \rangle_y - \langle S_{01} \rangle_y].$$

- Perturbative energy evolution
- Starts from a non-perturbative initial shape

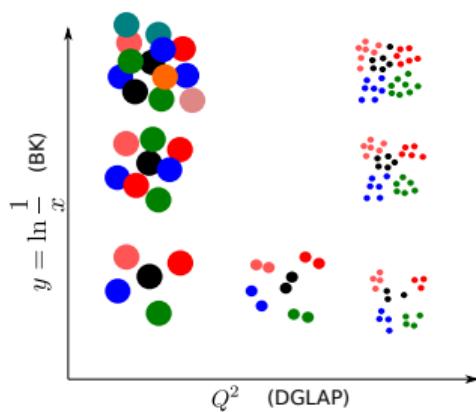

¹Mean field (large N_c) approx. of B-JIMWLK

Target evolution: BK equation

Target evolution is described approximatively¹ by the Balitsky-Kovchegov (BK) equation:

$$\partial_y \langle S_{01} \rangle_y = \frac{\bar{\alpha}_s}{2\pi} \int d^2 \mathbf{x}_2 \frac{\mathbf{x}_{01}^2}{\mathbf{x}_{02}^2 \mathbf{x}_{21}^2} [\langle S_{02} \rangle_y \langle S_{21} \rangle_y - \langle S_{01} \rangle_y].$$

- Perturbative energy evolution
- Starts from a non-perturbative initial shape
- Numerous successful LO phenomenology studies:
Albacete et al (2011), Lappi, Mäntysaari (2013); Iancu et al (2015), Albacete et al (2017)

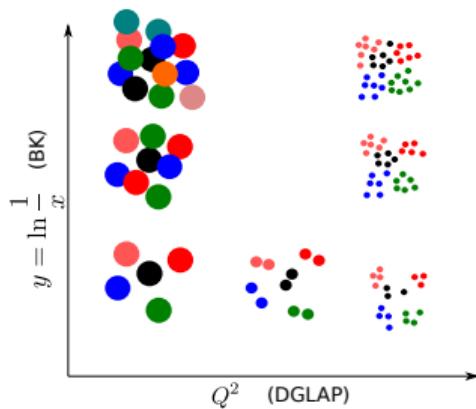

¹Mean field (large N_c) approx. of B-JIMWLK

Target evolution: BK equation

Target evolution is described approximatively¹ by the Balitsky-Kovchegov (BK) equation:

$$\partial_y \langle S_{01} \rangle_y = \frac{\bar{\alpha}_s}{2\pi} \int d^2 \mathbf{x}_2 \frac{\mathbf{x}_{01}^2}{\mathbf{x}_{02}^2 \mathbf{x}_{21}^2} [\langle S_{02} \rangle_y \langle S_{21} \rangle_y - \langle S_{01} \rangle_y].$$

- Perturbative energy evolution
- Starts from a non-perturbative initial shape
- Numerous successful LO phenomenology studies:
Albacete et al (2011), Lappi, Mäntysaari (2013); Iancu et al (2015), Albacete et al (2017)
- In a nutshell
 - ▶ Describe inclusive HERA data well
 - ▶ Simultaneous description of HERA heavy quark data not as good

¹Mean field (large N_c) approx. of B-JIMWLK

Beyond LO: Evolution in projectile rapidity Y

- Projectile rapidity $Y \sim \ln W^2$

²E. Iancu et al., Phys. Lett. B 744 (2015) 293

³G. Beuf, Phys. Rev. D 89 (2014) no. 7 074039

Beyond LO: Evolution in projectile rapidity Y

- Projectile rapidity $Y \sim \ln W^2$
- Higher order effects: resum large transverse log enhanced contributions

²E. Iancu et al., Phys. Lett. B 744 (2015) 293

³G. Beuf, Phys. Rev. D 89 (2014) no. 7 074039

Beyond LO: Evolution in projectile rapidity Y

- Projectile rapidity $Y \sim \ln W^2$
- Higher order effects: resum large transverse log enhanced contributions

Collinear resummation of large transverse logs leads to "ResumBK" ²

$$\partial_Y S(\mathbf{x}_{01}, Y) = \int d^2\mathbf{x}_2 K_{\text{DLA}} K_{\text{STL}} K_{\text{BK}} [S(\mathbf{x}_{02})S(\mathbf{x}_{21}) - S(\mathbf{x}_{01})].$$

²E. Iancu et al., Phys. Lett. B 744 (2015) 293

³G. Beuf, Phys. Rev. D 89 (2014) no. 7 074039

Beyond LO: Evolution in projectile rapidity Y

- Projectile rapidity $Y \sim \ln W^2$
- Higher order effects: resum large transverse log enhanced contributions

Collinear resummation of large transverse logs leads to "ResumBK" ²

$$\partial_Y S(\mathbf{x}_{01}, Y) = \int d^2 \mathbf{x}_2 K_{\text{DLA}} K_{\text{STL}} K_{\text{BK}} [S(\mathbf{x}_{02}) S(\mathbf{x}_{21}) - S(\mathbf{x}_{01})].$$

Another technique leads to a kinematic constraint (KCBK) and non-local equation ³

$$\begin{aligned} \partial_Y S(\mathbf{x}_{01}, Y) &= \int d^2 \mathbf{z} K_{\text{BK}} \theta(Y - \Delta_{012} - Y_{0,\text{if}}) \\ &\quad \times [S(\mathbf{x}_{02}, Y - \Delta_{012}) S(\mathbf{x}_{21}, Y - \Delta_{012}) - S(\mathbf{x}_{01}, Y)] \end{aligned}$$

²E. Iancu et al., Phys. Lett. B 744 (2015) 293

³G. Beuf, Phys. Rev. D 89 (2014) no. 7 074039

Beyond LO: Evolution in target rapidity η

Recent study⁴ argues that evolution should be expressed in $\eta \sim \ln \frac{1}{x_{Bj}}$:

$$\partial_\eta \bar{S}(\mathbf{x}_{01}, \eta) = \int d^2\mathbf{x}_2 K_{\text{BK}} \theta(\eta - \eta_0 - \delta) [\bar{S}(\mathbf{x}_{02}, \eta - \delta_{02}) \bar{S}(\mathbf{x}_{21}, \eta - \delta_{21}) - \bar{S}(\mathbf{x}_{01}, \eta)]$$

⁴B. Ducloué et al., JHEP 04 (2019) 081

⁵B. Ducloué et al., Phys. Lett. B803 (2020) 135305

Beyond LO: Evolution in target rapidity η

Recent study⁴ argues that evolution should be expressed in $\eta \sim \ln \frac{1}{x_{Bj}}$:

$$\partial_\eta \bar{S}(\mathbf{x}_{01}, \eta) = \int d^2\mathbf{x}_2 K_{\text{BK}} \theta(\eta - \eta_0 - \delta) [\bar{S}(\mathbf{x}_{02}, \eta - \delta_{02}) \bar{S}(\mathbf{x}_{21}, \eta - \delta_{21}) - \bar{S}(\mathbf{x}_{01}, \eta)]$$

- Evolution in η , DIS impact factors in Y : need shift $\eta = Y - \rho$
 - ▶ $\rho \equiv \ln \frac{1}{\min\{1, \mathbf{x}_{ij}^2 Q_0^2\}}$
- LO DIS fits done to HERA data with good results⁵.

⁴B. Ducloué et al., JHEP 04 (2019) 081

⁵B. Ducloué et al., Phys. Lett. B803 (2020) 135305

NLO DIS cross section in the Dipole Picture

Next-to-Leading Order $\gamma^* p$ cross section can be partitioned as

$$\sigma_{L,T}^{\text{NLO}} = \sigma_{L,T}^{\text{IC}} + \sigma_{L,T}^{qg} + \sigma_{L,T}^{\text{dip}},$$

⁶ G. Beuf, Phys.Rev.D **96**, 074033 (2017)

⁷ ‘unsub scheme’ of B. Ducloué et al., Phys.Rev.D **96**, 094017 (2017)

NLO DIS cross section in the Dipole Picture

Next-to-Leading Order $\gamma^* p$ cross section can be partitioned as

$$\sigma_{L,T}^{\text{NLO}} = \sigma_{L,T}^{\text{IC}} + \sigma_{L,T}^{qg} + \sigma_{L,T}^{\text{dip}},$$

where the NLO contributions are⁶ ⁷:

$$\begin{aligned}\sigma_{L,T}^{qg} &= 8N_c\alpha_{em}\frac{\alpha_s C_F}{\pi} \sum_f e_f^2 \int_0^1 dz_1 \int_{z_{2,\min}}^{1-z_1} \frac{dz_2}{z_2} \int_{\mathbf{x}_0, \mathbf{x}_1, \mathbf{x}_2} \mathcal{K}_{L,T}^{\text{NLO}}(z_1, z_2, \mathbf{x}_0, \mathbf{x}_1, \mathbf{x}_2), \\ \sigma_{L,T}^{\text{dip}} &= 4N_c\alpha_{em}\frac{\alpha_s C_F}{\pi} \sum_f e_f^2 \int_0^1 dz_1 \int_{\mathbf{x}_0, \mathbf{x}_1} \mathcal{K}_{L,T}^{\text{LO}}(z_1, \mathbf{x}_0, \mathbf{x}_1) \left[\frac{1}{2} \ln^2 \left(\frac{z_1}{1-z_1} \right) - \frac{\pi^2}{6} + \frac{5}{2} \right],\end{aligned}$$

$$z_2 = \text{gluon momentum fraction. } z_{2,\min} = e^{Y_{0,\text{if}}} x_{Bj} \frac{Q_0^2}{Q^2}$$

N.B. Evolution range is controlled by $z_{2,\min}$ at NLO.

⁶ G. Beuf, Phys.Rev.D **96**, 074033 (2017)

⁷ ‘unsub scheme’ of B. Ducloué et al., Phys.Rev.D **96**, 094017 (2017)

Initial condition and fit schemes

- Resolve the transient effect⁸ ($\sigma^{qg} \rightarrow 0$, $\sigma^{\text{dip}} \neq 0$) at $z_{2,\min} \approx 1$ by setting $Y_{0,\text{if}} = 0$
 - ▶ Effective dipole prescription needed $Y \in [Y_{0,\text{if}}, Y_{0,\text{BK}}]$:

⁸B. Ducloué et al., Phys.Rev.D **96**, 094017 (2017)

Initial condition and fit schemes

- Resolve the transient effect⁸ ($\sigma^{qg} \rightarrow 0$, $\sigma^{\text{dip}} \neq 0$) at $z_{2,\min} \approx 1$ by setting $Y_{0,\text{if}} = 0$
 - ▶ Effective dipole prescription needed $Y \in [Y_{0,\text{if}}, Y_{0,\text{BK}}]$:
- Parametrize at $Y_{0,\text{BK}} = Y_{0,\text{if}}$ or at $Y_{0,\text{BK}} > 0$ and freeze dipoles smaller rapidities
 - ▶ MV- γ amplitude shape

⁸B. Ducloué et al., Phys.Rev.D **96**, 094017 (2017)

Initial condition and fit schemes

- Resolve the transient effect⁸ ($\sigma^{qg} \rightarrow 0$, $\sigma^{\text{dip}} \neq 0$) at $z_{2,\min} \approx 1$ by setting $Y_{0,\text{if}} = 0$
 - ▶ Effective dipole prescription needed $Y \in [Y_{0,\text{if}}, Y_{0,\text{BK}}]$:
- Parametrize at $Y_{0,\text{BK}} = Y_{0,\text{if}}$ or at $Y_{0,\text{BK}} > 0$ and freeze dipoles smaller rapidities
 - ▶ MV- γ amplitude shape
- Evolution equations:
 - ▶ Projectile momentum fraction: KCBK and ResumBK
 - ▶ Target momentum fraction: TBK

⁸B. Ducloué et al., Phys.Rev.D **96**, 094017 (2017)

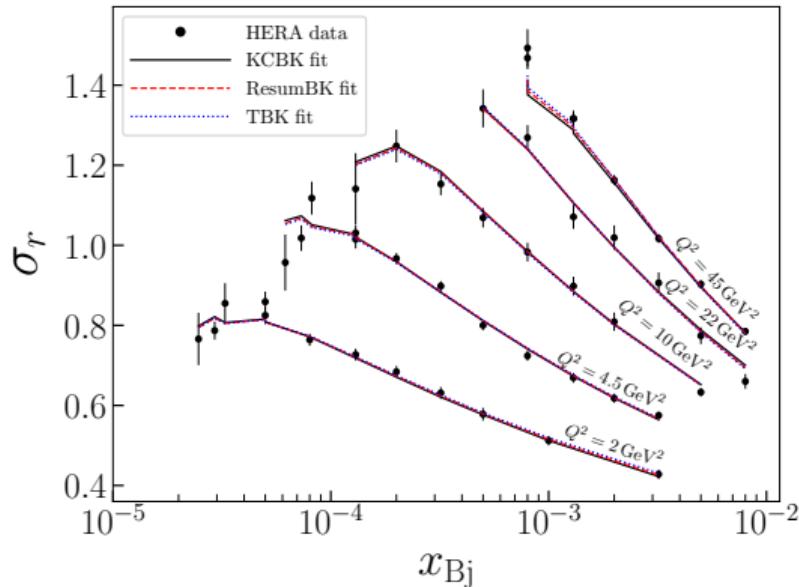

Initial condition and fit schemes

- Resolve the transient effect⁸ ($\sigma^{qg} \rightarrow 0$, $\sigma^{\text{dip}} \neq 0$) at $z_{2,\min} \approx 1$ by setting $Y_{0,\text{if}} = 0$
 - ▶ Effective dipole prescription needed $Y \in [Y_{0,\text{if}}, Y_{0,\text{BK}}]$:
- Parametrize at $Y_{0,\text{BK}} = Y_{0,\text{if}}$ or at $Y_{0,\text{BK}} > 0$ and freeze dipoles smaller rapidities
 - ▶ MV- γ amplitude shape
- Evolution equations:
 - ▶ Projectile momentum fraction: KCBK and ResumBK
 - ▶ Target momentum fraction: TBK
- Running coupling prescriptions
 - ▶ *smallest dipole*: Balitsky prescription in LOBK and smallest dipole elsewhere
 - Shortest lenght scale \sim largest momentum scale dominates
 - ▶ *parent dipole*

⁸B. Ducloué et al., Phys.Rev.D **96**, 094017 (2017)

Fits to HERA data

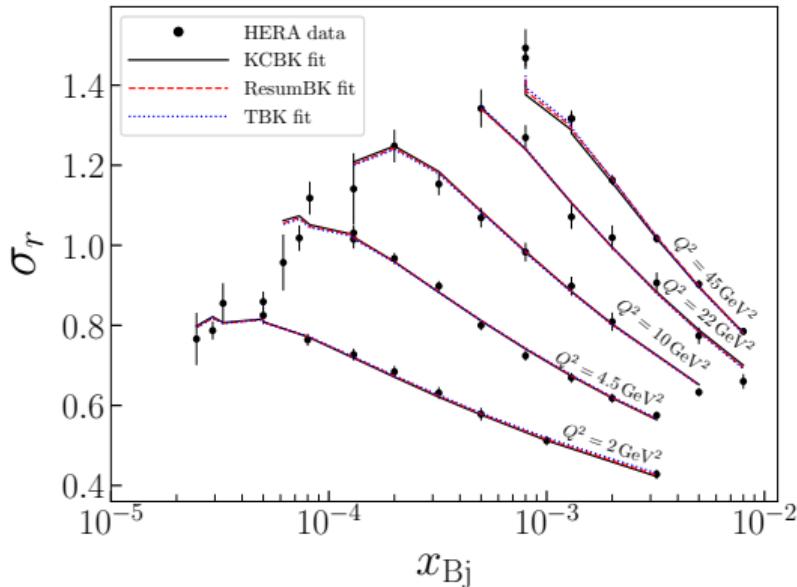

Parent dipole rc , $Y_{0,\text{BK}} = 0$

- All three BK equations can fit the full HERA data well.

Fits to HERA data

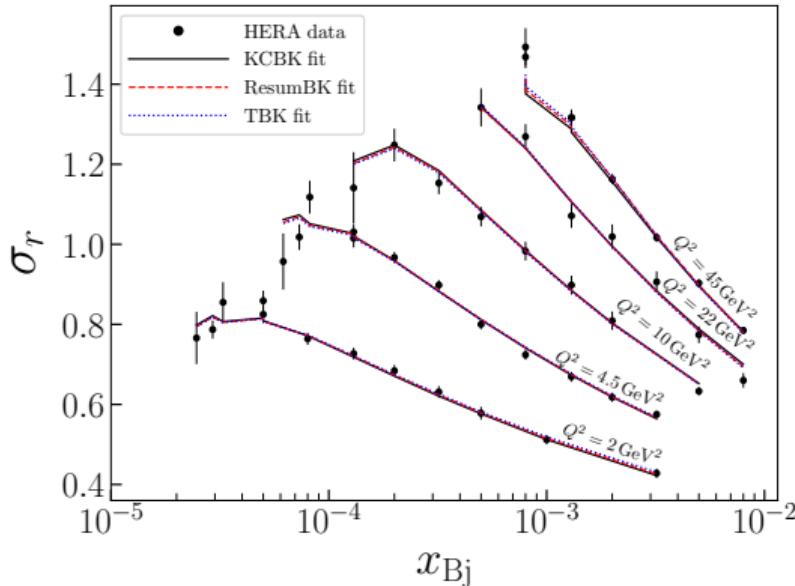

Parent dipole rc , $Y_{0,BK} = 0$

- All three BK equations can fit the full HERA data well.
- Even combined HERA data cannot differentiate between BK equations and running coupling scheme choices

Fits to HERA data

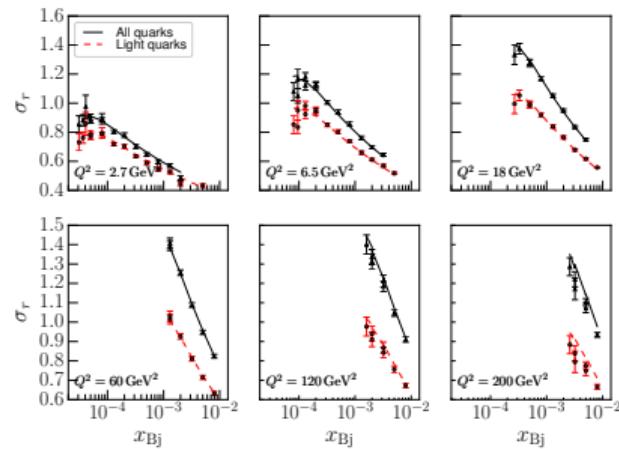

Parent dipole rc , $Y_{0,\text{BK}} = 0$

- All three BK equations can fit the full HERA data well.
- Even combined HERA data cannot differentiate between BK equations and running coupling scheme choices
- Balitsky + smallest dipole prescription used overall slightly worse in χ^2/N

Subtracting heavy quarks from HERA data

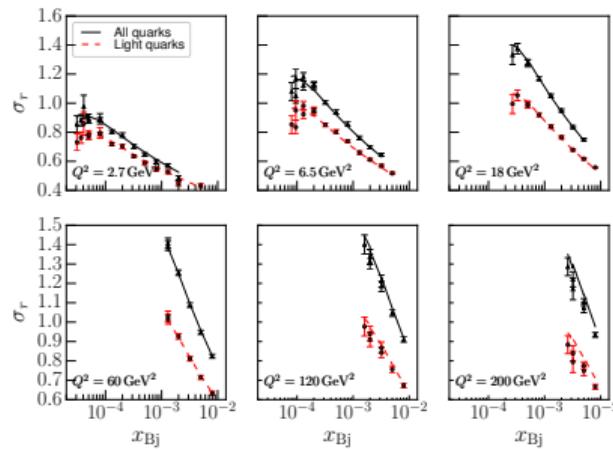

- NLO impact factors calculated only for massless quarks

The solid and dashed lines show the calculated cross sections from the IPsat fit that are used to generate the pseudodata.

Subtracting heavy quarks from HERA data

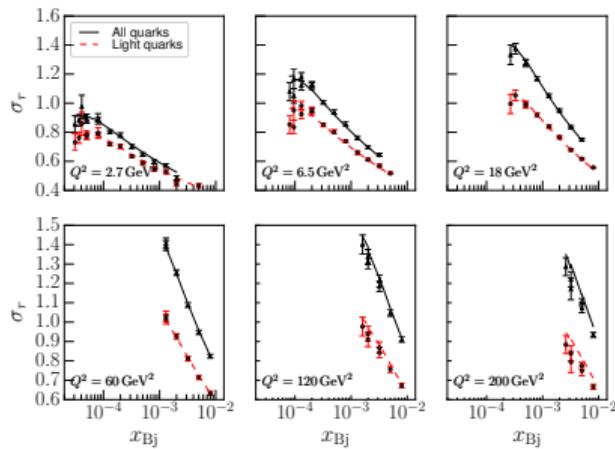

- NLO impact factors calculated only for massless quarks
- Fit "light quark reduced cross section" data made from HERA data by subtracting heavy quarks

The solid and dashed lines show the calculated cross sections from the IPsat fit that are used to generate the pseudodata.

Subtracting heavy quarks from HERA data

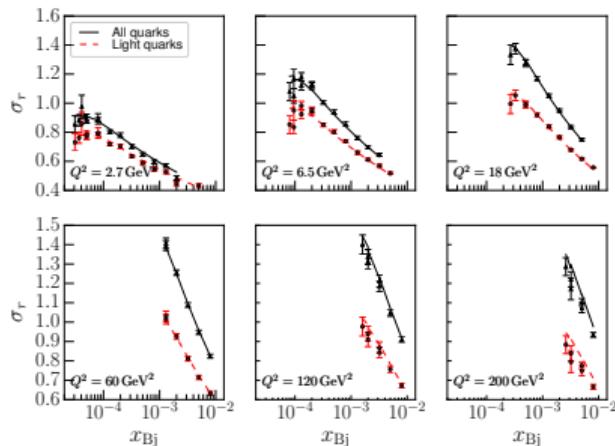

- NLO impact factors calculated only for massless quarks
- Fit "light quark reduced cross section" data made from HERA data by subtracting heavy quarks
- Charm, bottom contributions not measured in same bins as full cross sections

The solid and dashed lines show the calculated cross sections from the IPsat fit that are used to generate the pseudodata.

Subtracting heavy quarks from HERA data

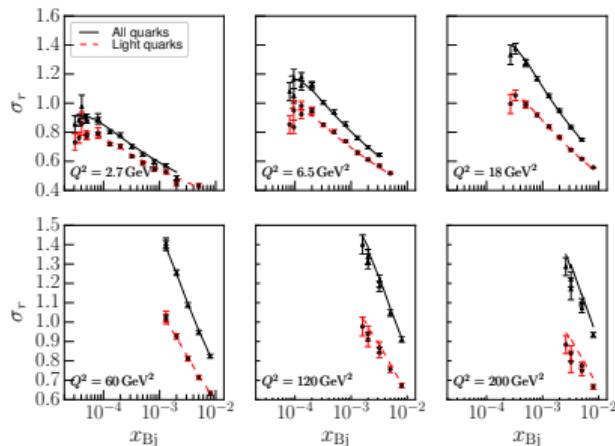

The solid and dashed lines show the calculated cross sections from the IPsat fit that are used to generate the pseudodata.

- NLO impact factors calculated only for massless quarks
- Fit "light quark reduced cross section" data made from HERA data by subtracting heavy quarks
- Charm, bottom contributions not measured in same bins as full cross sections
- Interpolate c, b data with LO IPsat fit^a

Subtracting heavy quarks from HERA data

The solid and dashed lines show the calculated cross sections from the IPsat fit that are used to generate the pseudodata.

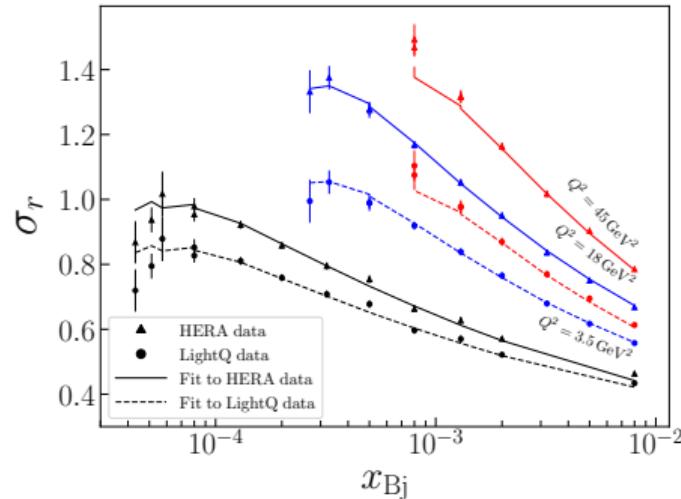

- NLO impact factors calculated only for massless quarks
- Fit "light quark reduced cross section" data made from HERA data by subtracting heavy quarks
- Charm, bottom contributions not measured in same bins as full cross sections
- Interpolate c, b data with LO IPsat fit^a
- Uncertainties not modified

Fits to light quark data

NLO CGC can fit light quark data as well.

Fits to light quark data

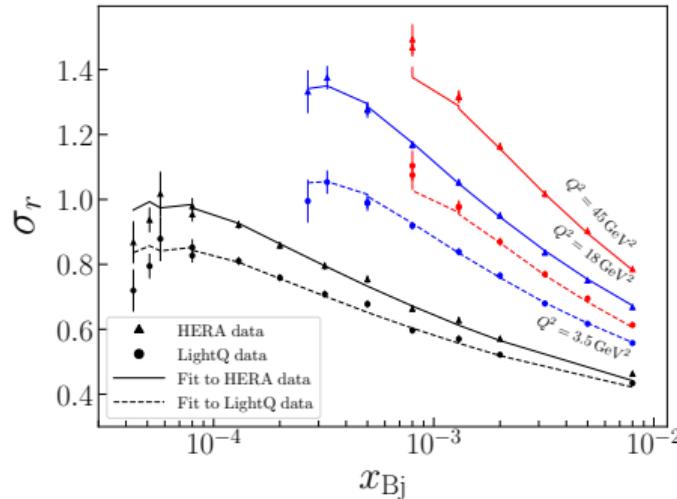

NLO CGC can fit light quark data as well.

- Light quarks need larger σ_0 and C^2 : Large slowly evolving non-perturbative contribution.

Fits to light quark data

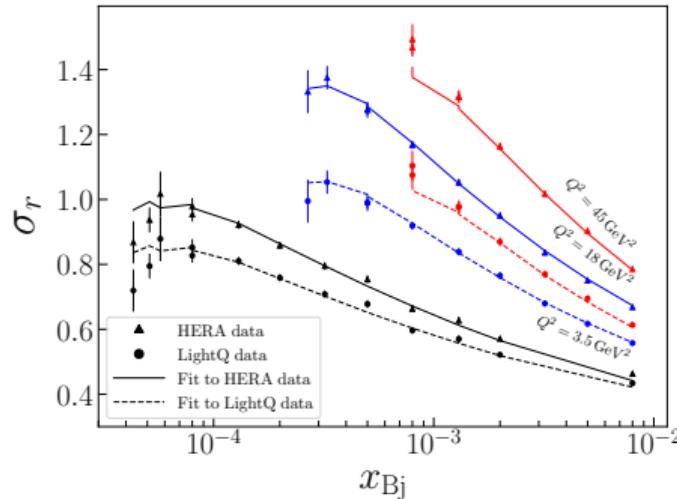

NLO CGC can fit light quark data as well.

- Light quarks need larger σ_0 and C^2 : Large slowly evolving non-perturbative contribution.
- Fitted parameters effectively take into account non-perturbative effects

Fits to light quark data

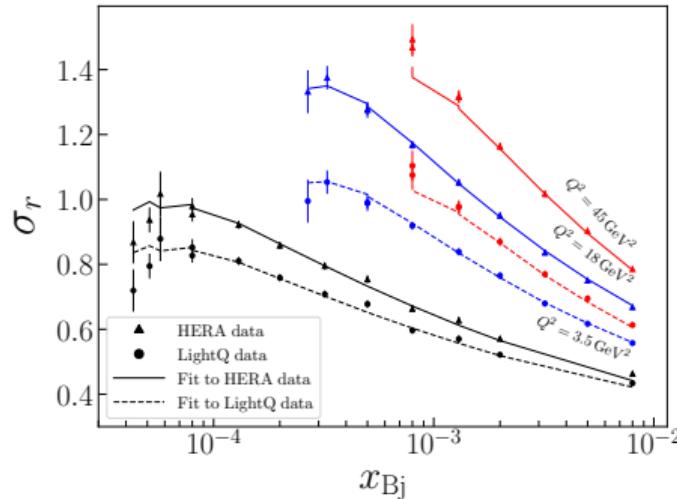

NLO CGC can fit light quark data as well.

- Light quarks need larger σ_0 and C^2 : Large slowly evolving non-perturbative contribution.
- Fitted parameters effectively take into account non-perturbative effects
- $\alpha_s(k^2 \sim C^2/r^2)$

Fits to light quark data

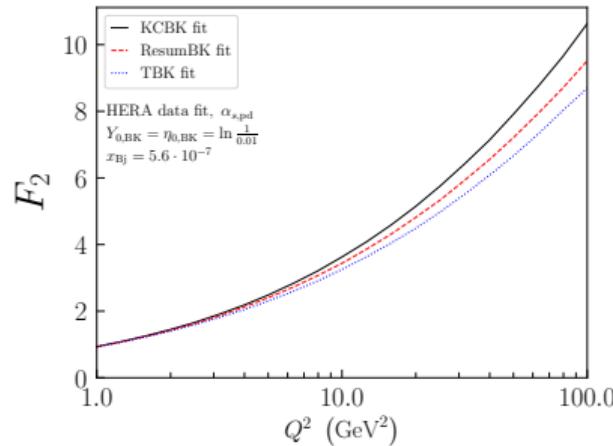

NLO CGC can fit light quark data as well.

- Light quarks need larger σ_0 and C^2 : Large slowly evolving non-perturbative contribution.
- Fitted parameters effectively take into account non-perturbative effects
- $\alpha_s(k^2 \sim C^2/r^2)$

Data	α_s	χ^2/N	$Q_{s,0}^2$	C^2	γ	$\sigma_0/2$ [mb]
HERA	parent	1.85	0.0833	3.49	0.98	9.74

BK predictions at LHeC kinematics

- Anomalous dimension evolves differently in Y and η evolution, possible effect in Q^2 evolution

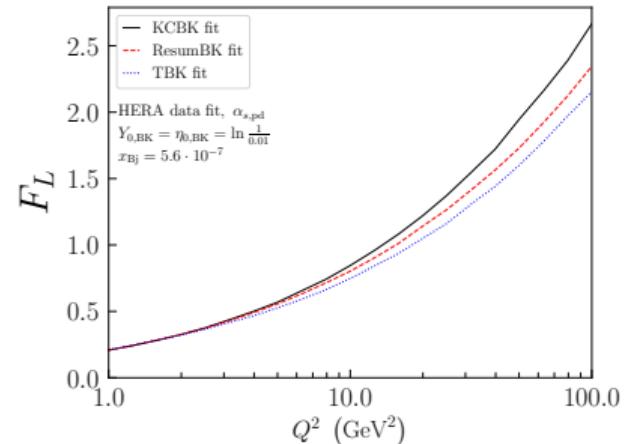

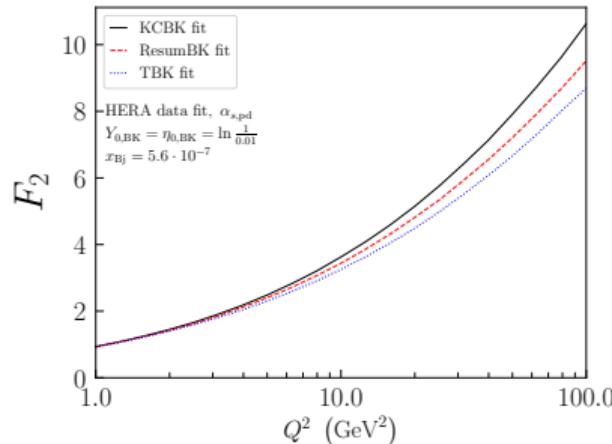

BK predictions at LHeC kinematics

- Anomalous dimension evolves differently in Y and η evolution, possible effect in Q^2 evolution
- Differences moderate even at LHeC kinematics

BK predictions at LHeC kinematics

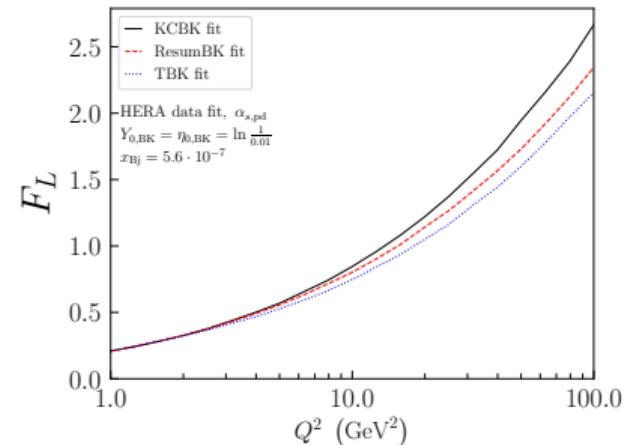

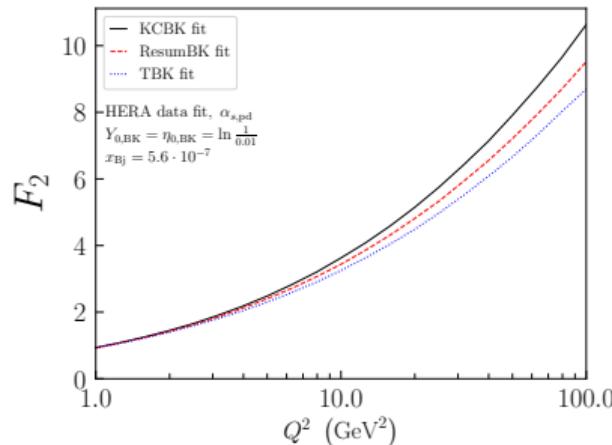

- Anomalous dimension evolves differently in Y and η evolution, possible effect in Q^2 evolution
- Differences moderate even at LHeC kinematics

- Effect between Y and η evolution slightly enhanced

BK predictions at LHeC kinematics

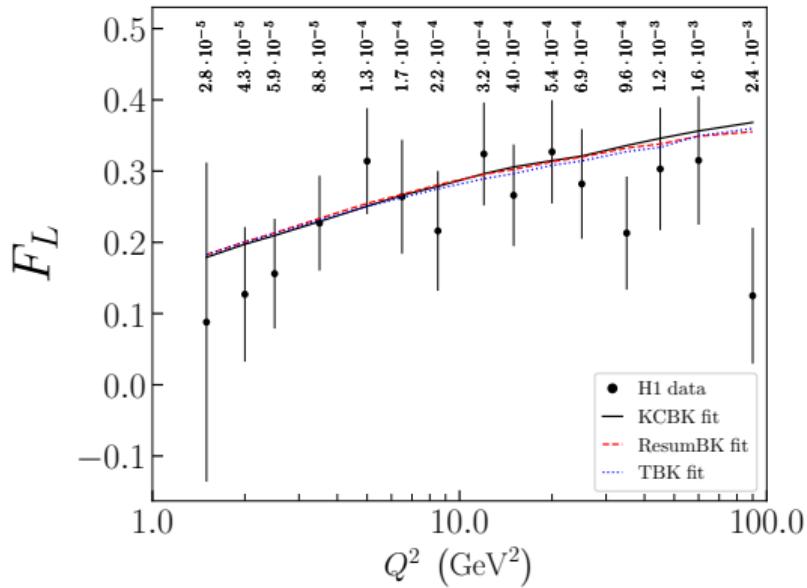

- Anomalous dimension evolves differently in Y and η evolution, possible effect in Q^2 evolution
- Differences moderate even at LHeC kinematics

- Effect between Y and η evolution slightly enhanced
- F_L is sensitive to smaller dipoles

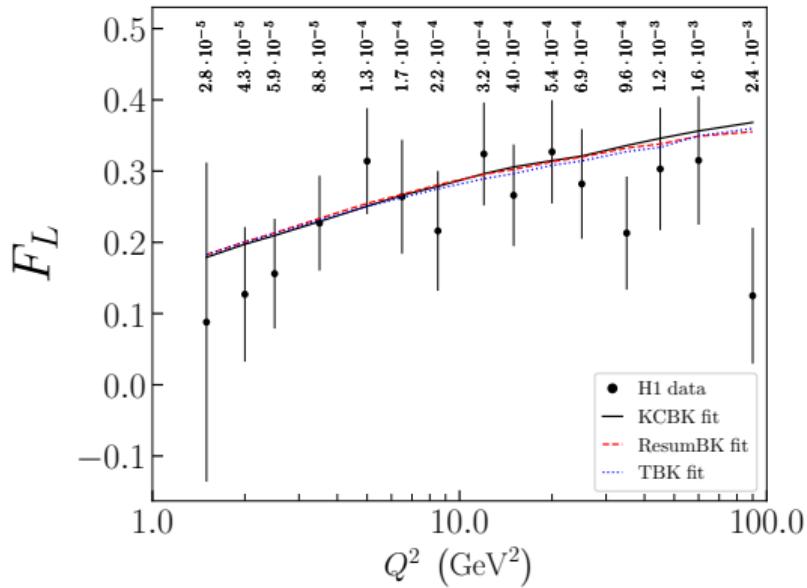

Fit comparison to H1 F_L data

- F_L computed with HERA σ_{red} fits compared to H1 F_L data

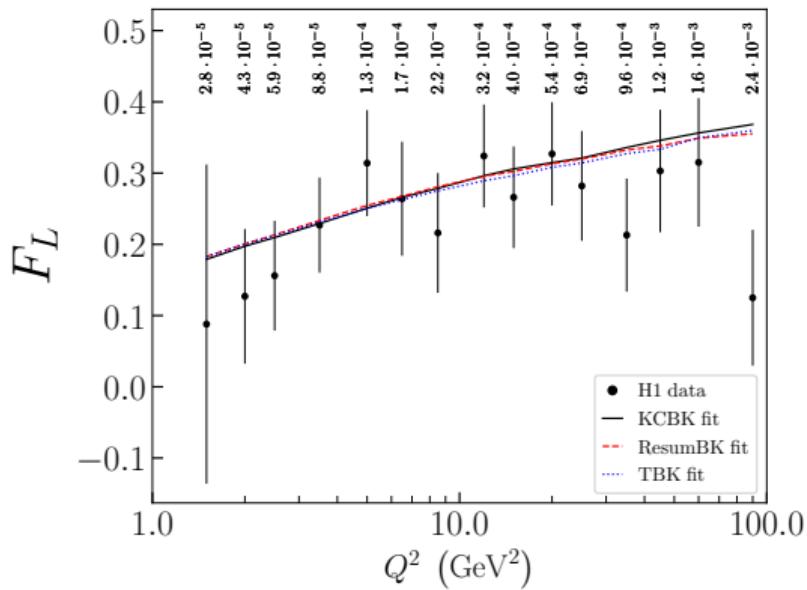

Fit comparison to H1 F_L data

- F_L computed with HERA σ_{red} fits compared to H1 F_L data
- Fits describe F_L nicely

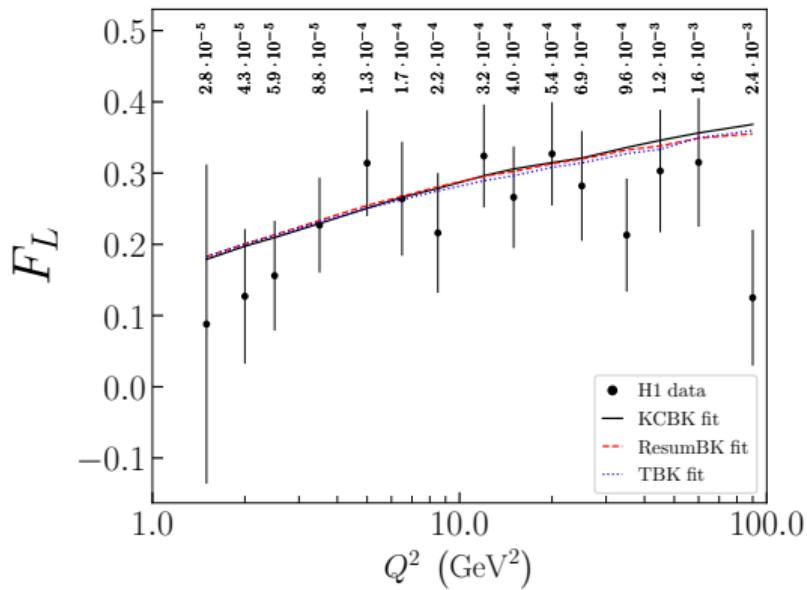

Fit comparison to H1 F_L data

- F_L computed with HERA σ_{red} fits compared to H1 F_L data
- Fits describe F_L nicely
- KCBK, ResumBK and TBK equivalent

Fit comparison to H1 F_L data

- F_L computed with HERA σ_{red} fits compared to H1 F_L data
- Fits describe F_L nicely
- KCBK, ResumBK and TBK equivalent
- Would start to see differences between evolutions at smaller x_{Bj} , moderately high Q^2

Conclusions

- NLO DIS cross section and small-x evolution: first NLO fits to HERA data
 - ▶ KCBK, ResumBK, and TBK all describe the combined HERA data well

Conclusions

- NLO DIS cross section and small-x evolution: first NLO fits to HERA data
 - ▶ KCBK, ResumBK, and TBK all describe the combined HERA data well
- Important test for CGC at NLO

Conclusions

- NLO DIS cross section and small-x evolution: first NLO fits to HERA data
 - ▶ KCBK, ResumBK, and TBK all describe the combined HERA data well
- Important test for CGC at NLO
- Would be preferable to fit precise $F_{2,c}$
 - ▶ Will include massive quarks when NLO impact factors become available

Conclusions

- NLO DIS cross section and small-x evolution: first NLO fits to HERA data
 - ▶ KCBK, ResumBK, and TBK all describe the combined HERA data well
- Important test for CGC at NLO
- Would be preferable to fit precise $F_{2,c}$
 - ▶ Will include massive quarks when NLO impact factors become available
- Precise F_2 and F_L data over a wide kinematical range in x and Q^2 can help to constrain the evolution

Thank you!

Fits to HERA and light quark data with Target momentum fraction BK.

Evolution of anomalous dimension $\gamma(r) = \frac{d \ln N(r)}{d \ln r^2}$

- In Y , at $r \sim 1/Q_s$, parent dipole increases, smallest dipole decreases γ
- At asymptotically small dipoles γ fixed
- Evolved γ meet on a curve that fits the data

- In η , evolution at $r \sim 1/Q_s$ decreasing with either coupling
- Evolves towards asymptotic $\gamma \sim 0.6$ at large η
