

10th International Conference on Hard and Electromagnetic Probes of High-Energy Nuclear Collisions

Contribution ID: 249

Type: Poster

Jet and Di-jet Underlying Event in p+Au collisions at $\sqrt{s_{NN}} = 200$ GeV at STAR

Tuesday, June 2, 2020 7:30 AM (1h 20m)

Proton-ion collisions have been included in runs at the LHC and RHIC in addition to proton-proton and heavy ion collisions as a means of studying cold nuclear matter (CNM) effects. These asymmetric systems have yielded some unexpected trends, notably in measurements of nuclear modification factors at different centralities. Detectors at forward/backward rapidity have been used as a proxy for centrality or event activity (EA) in p+Au collisions in order to avoid auto-correlations in mid-rapidity measurements. In this poster, we show correlations of backward-rapidity (Au-going) event activity with mid-rapidity underlying event (UE) in p+Au collisions at $\sqrt{s_{NN}} = 200$ GeV measured with the STAR detector. We present UE measurements and show the trends of UE in relation to EA for high-transverse momentum (p_T) jet events vs. di-jet events. Additionally, we will study collision kinematics via observables including jet rapidity (η) and jet p_T as a means of investigating the initial hard scattering of partons in these events.

Collaboration (if applicable)

STAR

Track

Jets and High Momentum Hadrons

Contribution type

Poster

Primary author: STAR COLLABORATION

Presenter: VERKEST, Veronica (Wayne State University)

Session Classification: Poster session

Track Classification: Jets and High Momentum Hadrons
