# Motivation

Peter Paul Rubens, Jan Brueghel the Elder

- Baryon asymmetry of the visible Universe.
- Baryogenesis from B meson oscillations:  
Elor, Escudero & Nelson [1810.00880]
- Self-contained model (SUSY)
  - Full flavor structure
  - DM = RH sneutrinoAlonso-Álvarez, Elor, Nelson & Xiao [1907.10612]
- **Very testable scenario.**

# Main ideas

1. Baryogenesis and dark matter are linked.
2. The baryon asymmetry is related to B-meson observables.
3. SUSY theory contains all the ingredients.
4. Fully testable model: flavor, collider & astrophysical observables.

# If you want to know more...

1. Go to Miguel Escudero's talk this afternoon

**Baryogenesis and Dark Matter from B Mesons**

In this talk, based on arXiv:1810.00880, I will present a new mechanism of Baryogenesis and dark matter production in which both the dark matter relic abundance and the baryon asymmetry arise from neutral B meson oscillations and subsequent decays.

**Direct Detection**  
m, IFT (Madrid)

**at accelerators**  
m, IFT (Madrid)

**Presenter** Miguel Escudero

**Can CP violation in neutral meson oscillations explain the matter-antimatter asymmetry of the Universe?**

**Baryogenesis from neutral B meson oscillations**

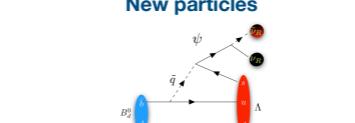

**Sakharov condition I**  
Out of equilibrium late time decay  
 $\bar{b} \rightarrow b$   
 $T_{RH} \sim 20$  MeV

**Sakharov condition II**  
CP violating oscillations  
 $B^+ \leftrightarrow B_s^0$ ,  $B^- \leftrightarrow \bar{B}_d^0$ ,  $B^0 \leftrightarrow \bar{B}_s^0$   
 $A_{\ell\ell}^d \rightarrow A_{\ell\ell}^s$

**Sakharov condition III**  
B-mesons decay into Dark Matter and hadrons  
 $B \rightarrow \nu_R \text{ Dark Matter anti-Baryon}$   
 $\Lambda \rightarrow \text{Baryon}$   
BR( $B \rightarrow \phi \xi + \text{Baryon} + \dots$ )

**Baryogenesis**  
 $Y_B = 8.7 \times 10^{-11}$   
&  
Dark Matter  
 $\Omega_{DM} h^2 = 0.12$

**Producing B mesons and baryon asymmetry cosmologically.** Adapted from arxiv:1810.00880.

**New particles**  

Particle	Mass	Description	SUSY
$\Phi$	11-100 GeV	Late-decaying scalar	Modulus, inflaton...
$\tilde{q}$	1 - 4 TeV	Color-triplet scalar	Square
$\psi$	1.2 - 4.2 GeV	Mediator	Dirac bino
$\tilde{\nu}_R$	0.3 - 2.7 GeV	Dark sector fermion	RH neutrino
$\tilde{\nu}_R$	1.2 - 2.7 GeV	DM scalar baryon	RH sneutrino

**Constraints and testability**

**Particle physics**

- Semileptonic asymmetries
- Flavor violation
- Exotic B decays
- Br( $B \rightarrow B + X$ )  $\gtrsim$  few  $\cdot 10^{-4}$
- Long lived particles
  - Bino / RH neutrino
  - Faser, Mathusla, SHiP, ...
- Supergravity & RPV

**Astrophysics**

- Neutrino masses
- $y_N \sin \beta \sim 10^{-8}$
- DM decay
- $\tilde{\nu}_R \rightarrow \nu + \bar{u} + \bar{d} + \bar{s}$
- Neutron stars
  - Production  $m_{\tilde{\nu}_R} \gtrsim 1.2$  GeV
  - Capture

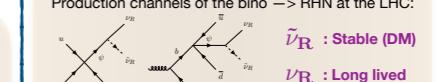

**Semileptonic asymmetries**  
Measure the amount of CPV in B meson oscillations  
SM values are small to generate the baryon asymmetry

**SM:**  $A_{\ell\ell}^d|_{\text{SM}} = (2.22 \pm 0.27) \times 10^{-5}$   
 $A_{\ell\ell}^s|_{\text{SM}} = (-4.7 \pm 0.6) \times 10^{-4}$

**Exp:**  $A_{\ell\ell}^d|_{\text{exp}} = (-0.6 \pm 2.8) \times 10^{-3}$   
 $A_{\ell\ell}^s|_{\text{exp}} = (-2.1 \pm 1.7) \times 10^{-3}$

Eg: bino-squark box diagram

**RH sneutrino asymmetric DM**  
The Dirac bino decays  $\psi \rightarrow \tilde{\nu}_R + \nu_R$   
Asymmetric sneutrino DM generated at baryogenesis  
Symmetric component is usually overproduced, but efficiently annihilates into neutrinos

**Test: long-lived particles**  
Production channels of the bino  $\rightarrow$  RHN at the LHC:  

- $\tilde{\nu}_R$  : Stable (DM)
- $\nu_R$  : Long lived

- If  $m_{\nu_R} \lesssim m_{\tilde{\nu}_R}$ , usual charged/neutral current decays
- If  $m_{\nu_R} > m_{\tilde{\nu}_R}$ , new LLD decay:  $\nu_R \rightarrow \tilde{\nu}_R \bar{u} \bar{d} \bar{s}$

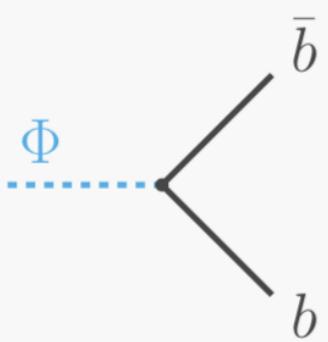

**Search:** Prompt b jet + MET / LLD of RH neutrino

**U(1)<sub>R</sub> SUSY with Dirac gauginos can accommodate baryogenesis & sterile sneutrino asymmetric DM production**

# Baryogenesis mechanism

## Sakharov I

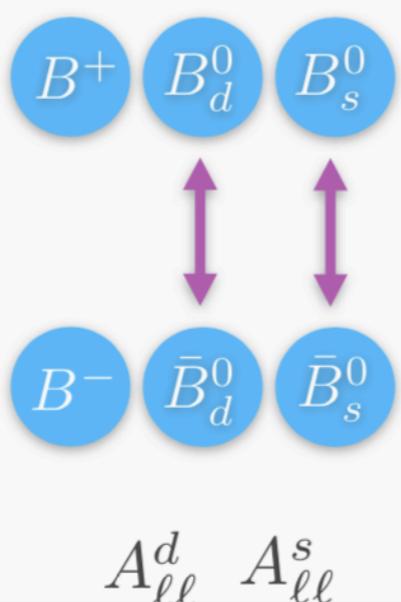

Out of equilibrium  
late time decay

$$T_{\text{RH}} \sim 20 \text{ MeV}$$

## Sakharov II

CP violating oscillations

## Sakharov III

B-mesons decay into  
Dark Matter and hadrons

$$\text{BR}(B \rightarrow \phi\xi + \text{Baryon} + \dots)$$

## Baryogenesis

$$Y_B = 8.7 \times 10^{-11}$$

&

## Dark Matter

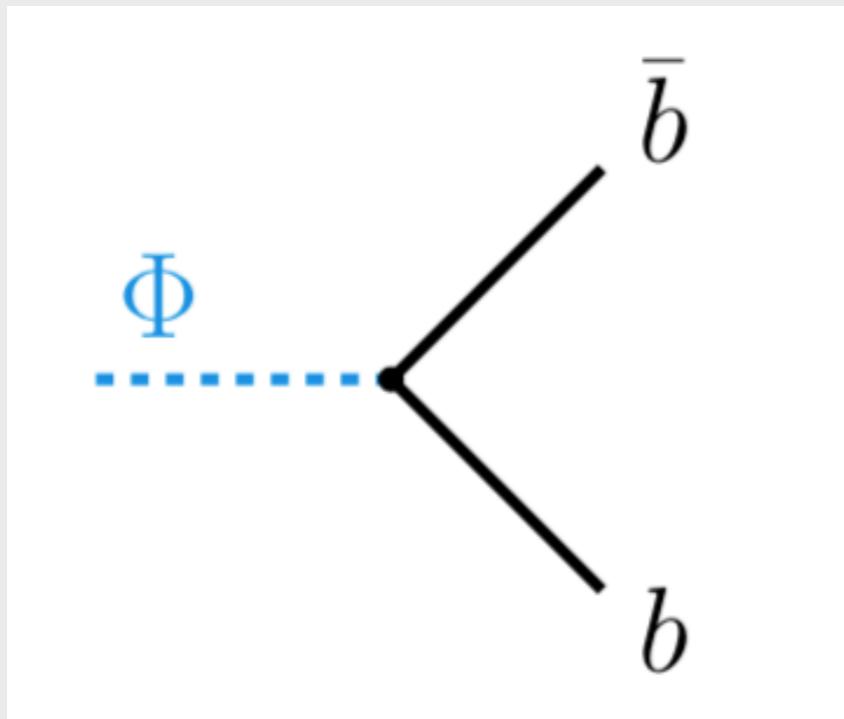

$$\Omega_{\text{DM}} h^2 = 0.12$$

# New particles & SUSY model

Particle	Mass	Description	SUSY

# New particles & SUSY model

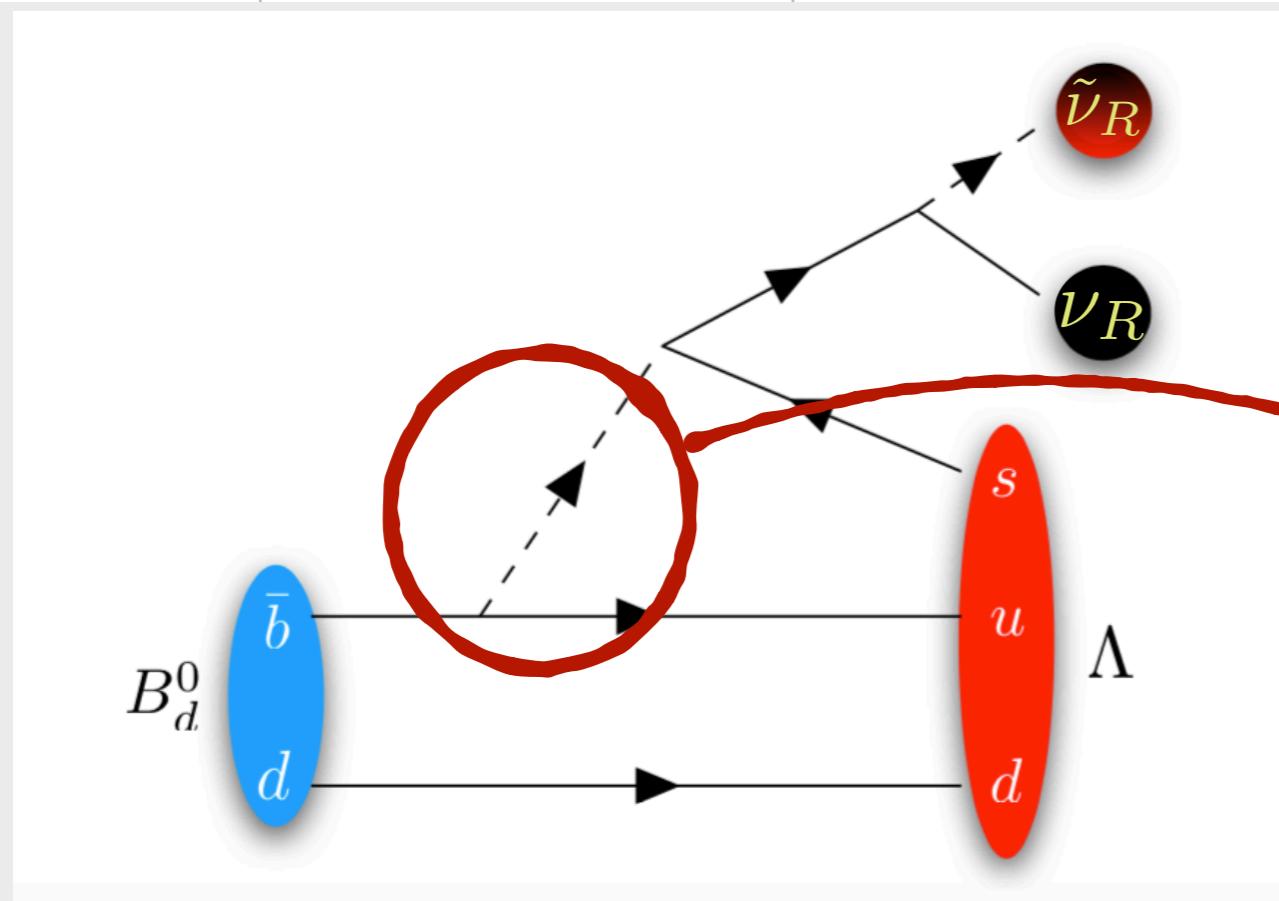

Particle	Mass	Description	SUSY
$\Phi$	11-100 GeV	Late-time decaying scalar	Modulus, inflaton, ...

A scalar with mass  
 $m_\Phi \in 11 - 100 \text{ GeV}$   
generically decays into  $b$  quarks.

# New particles & SUSY model

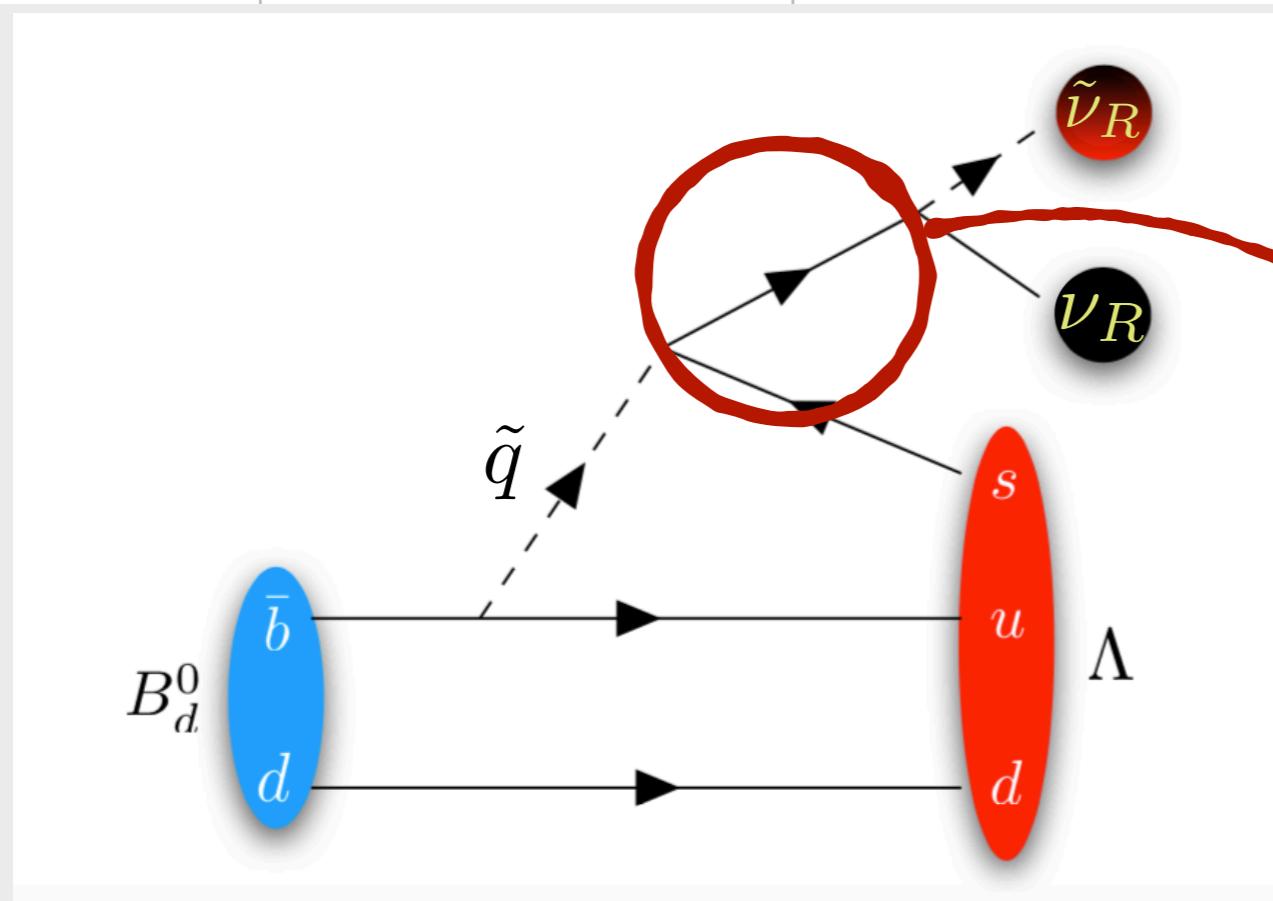

Particle	Mass	Description	SUSY
$\Phi$	11-100 GeV	Late-time decaying scalar	Modulus, inflaton, ...
$\tilde{q}$	1 - 4 TeV	Color-triplet scalar	Squark

Color-triplet scalar  
coupling to quarks

# New particles & SUSY model

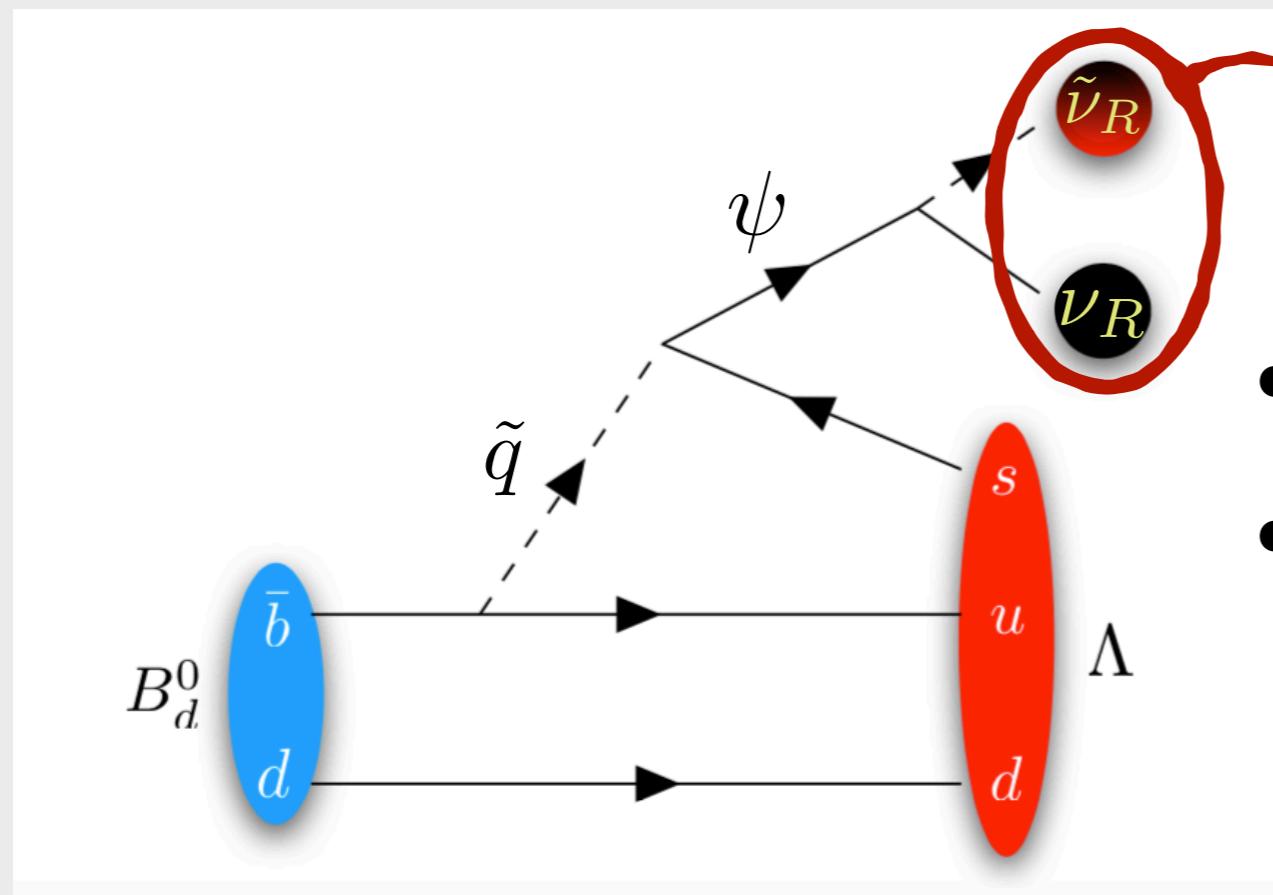

Particle	Mass	Description	SUSY
$\Phi$	11-100 GeV	Late-time decaying scalar	Modulus, inflaton, ...
$\tilde{q}$	1 - 4 TeV	Color-triplet scalar	Squark
$\psi$	1.2 - 4.2 GeV	Mediator	Dirac bino

Dirac fermion connecting  
the visible and dark sectors

# New particles & SUSY model

Particle	Mass	Description	SUSY
$\Phi$	11-100 GeV	Late-time decaying scalar	Modulus, inflaton, ...
$\tilde{q}$	1 - 4 TeV	Color-triplet scalar	Squark
$\psi$	1.2 - 4.2 GeV	Mediator	Dirac bino
$\nu_R$	0.3 - 2.7 GeV	Dark sector fermion	RH neutrino
$\tilde{\nu}_R$	1.2 - 2.7 GeV	Dark sector scalar baryon	RH sneutrino

- Dark sector singlet states:
- Fermion: RH neutrino
  - Scalar baryon: RH sneutrino

**Good DM candidate!**

# A very testable scenario

## Particle physics

- Semileptonic asymmetries
- Flavor violation
